ALFALFA LEAF WEEVIL.

Alfalfa growers of Arizona are vitally interested and somewhat alarmed at the havoc wrought in the Utah alfalfa fields. The pest is not yet in Arizona, and their hope is to prevent its entrance. In this effort California should join. The hope is that by memorializing conrgess aid may be secured of the Department of Agriculture.

After referring to the damage from the pest the memorial prepared says:

"In this emergency Arizona is without means of protection, having no adequate law nor available appropriation to meet the situation. Furthermore the steps that should be taken to hinder the spread of the alfalfa weevil are to a large extent protective to all alfalfa growing sections in the United States outside of the portion of Utah which is already infested. It is believed by your memorialists that it is a matter of national importance that every reasonable effort be made to protect against the spread of these insects.

"In consideration of the facts and circumstances which have been stated, we respectfully urge that in addition to appropriating the sum of $10,000 for investigating the alfalfa leaf weevil, as requested by the chief of the bureau of entomology, there be appropriated the sum of $25,000 for the purpose of devising means for checking the spread of this pest, and for practical work in accomplishing this end by locating and exterminating incipient isolated colonies by co-operating with common carriers and by other means."

Amongst the reasons given for the need of the appropriation are:

"The total amount of land now devoted to the growing of alfalfa in Arizona is approximately 120,000 acres, of which 65,000 acres are in one body under the Salt River Irrigation Project of the United States Reclamation Service. At the rate of $150 per acre, this crop represents an investment to Arizona ranchers of $18,000,000. The value of the alfalfa crop in Arizona amounts to more than $6,000,000 per annum. The alfalfa crop is the backbone of our agricultural system. No crop could take its place without a tremendous loss to all business interests, and the failure for any cause of the alfalfa industry would be a great calamity.

"The industry is now greatly endangered by the presence of a most destructive insect pest in an adjoining state. The alfalfa leaf weevil is stated in the report of the chief of the bureau of entomology, U. S. Department of Agriculture, to constitute a great menace to alfalfa culture, and an appropriation of $10,000 for an investigation of the pest has been requested. The importance of the pest is set forth in detail in a recent bulletin of the Utah Agricultural Experiment Station, No. 110. In this bulletin the means of spread of this alfalfa pest are discussed and the prediction made that it will probably be a question of but a short time before the insect will be generally distributed over the alfalfa growing regions of the United States. Railroad trains are recognized as the most important agency in the spread of the pest.

"The alfalfa growing sections of Arizona and doubtless many such sections outside of this territory are so isolated that a small expenditure in efforts to check the spread of the weevil from the region at present infested would mean a saving of many millions of dollars. Arizona is especially menaced by the importation of livestock and household goods in carlots by prospective settlers from Utah. In cars containing such goods, alfalfa hay and other material likely to harbor the adult weevils is frequently shipped, and disastrous consequences are most certain to result in the near future unless steps are taken to supervise properly shipments of this kind."

PRODUCTION OF PORTLAND CEMENT.

The production of Portland cement made a new high record in the year 1910. From statistics and estimates received by the United States Geological Survey from about 20 per cent of the companies manufacturing Portland cement, representing nearly half of the entire output of the country, it is estimated by E. F. Burchard, of the Survey, that the quantity of Portland cement manufactured in the United States in 1910 was between 73,500,000 and 75,000,000 barrels, as compared with 63,508,471 barrels produced in 1909—an increase of 10,000,000 to 12,500,000 barrels, or 15 to 20 per cent. The figures at hand are derived from all parts of the United States, and are therefore considered to be representative of the country at large rather than of any single section or district.

Although the average values for 1910 appear, from returns received thus far, to have been slightly higher than in 1909, prices were far from satisfactory, especially to the large manufacturers in the Lehigh Valley district and in certain of the Eastern states. The year 1911 opens with prices cut 5 to 10 cents a barrel lower than those prevailing in 1910. The construction of several new plants has been pushed during the year, and several plants that were under construction in 1909 became producers in 1910, so that the kiln capacity remains far in advance of the demand.

POURING VS. IMMERSION.

A correspondent in Coleman's Rural gives the following method of eradicating tick on sheep:

"I notice in a recent issue that you advise to dip sheep for lice, ticks, etc., while they have their long coats on. I have found what I believe to be a much better way, and only requires a small amount of dip. Turn the sheep on its back and pour about a quart of dip along the under side of the animal, from chin back to the end of body, put a little on the legs, hold the sheep for a few moments while the dip runs around the body, which it will do, as it is the wrong way of the wool. If you pour the dip on the sheep's back it will run off and do no good. I tried this method on seventy-five head a few days since and cannot find a tick on the 1909 crop of lambs. Some of the large ewes need a little more than a quart of the dip. I mixed the dip with warm water and two of us did the work in about two and one-half hours, and do not believe we lost more than a quart of the material that ran off after we let go of the sheep. If sheep men in general would try this plan I believe their dipping tanks would become useless property."

"Let There be Light."

—PAT HENRY, before the battle of Bull Run.

We are not sure that our old friend Pat has been correctly quoted, neither do we know that he was anywhere near Bull Run during that memorial event, but we do know that every Rancher, Miner, Dairyman, Stableman and Teamster on the Pacific Coast should be in possession of at least one of our Vehicle Headlights, here illustrated.

There are times when a good, strong light is almost indispensable. It is needed around the barn, the thrasher, the harvester, on the gang-plow, on your wagon or buggy when driving over rough roads, the ranch, the mine or the dairy.

A Boesch Vehicle Headlight is worth a dozen ordinary hand lanterns. They are well made, strong and durable, each one is fitted with a highly polished silver plated parabolic reflector which concentrates the rays of light with remarkable brilliancy. The body is finished in a rich glossy black with polished brass trimmings, and for appearance it is first in order of handsome lamps. It embodies all our latest improvements, and for efficiency as a light producer it is without equal. This is the Headlight that caused the passing of the State Law prohibiting the hunting of wild ducks by artificial light. It is being used by nearly every Fire Department on the Coast and in many of the large Eastern cities.

Do not be led into buying a cheap, inferior lamp. It won't pay. This one is the result of forty-two years' experience in the business. It is home industry, and we guarantee satisfaction. It is made in 6, 8 and 12-inch sizes, measurements across the face.

We also manufacture many other styles of Headlights, Lamps, Lanterns, etc., too numerous to mention.

Write for Catalogue and full particulars of lamps or lanterns that you require.

WATSONVILLE, CAL.

MEXICAN LAND

States of Sonora and Sinaloa

Tracts of all sizes at low prices.

We have several tracts of from 1000 acres up, at first cost. These would make ideal small colonies, for parties who contemplate co-operating in purchasing land in Mexico. They are fine soil, good water conditions, and close to the railroad. We can save you subdividers' costs and profits if you and your friends can handle one of these tracts. They are suitable for anything from general farming to fine fruit and vegetable raising.

Our Santa Teresa de La Concordia subdivision, near Hermosillo, the capital city of Sonora, is delta soil, and is watered by the flood water irrigation system, corn, bean, garbanzo, and cotton land, $5.00 and $10.00 per acre, easy terms, 160-acre tracts. Fine river bottom silt soil, in the State of Sinaloa, with gravity or shallow well water for irrigation. Prices in small tracts, $12.00 up an acre, according to location and improvements.

Arrange to join one of our excursions which we are sending down at frequent intervals. Write us for free illustrated booklets and bulletin of prices.

Questions and Answers

THE EDITOR AND STAFF

Questions to be answered in this department should be received at this office one week before reply is expected. Write plainly on one side of the paper and sign full name and address. Unsigned communications receive no attention.

Pasteurizing.

Have read much of pasteurized cream as promising and would be glad if you would give a few lines of advice as to cost and difference in selling price. Is it probable that compulsory pasteurizing will come ultimately?—Subscriber, Ripon.

Unless our subscriber has a very large dairy it would not pay to pasteurize. The requirements are a steam boiler, pasteurizer and cooler. The pasteurizer and cooler will cost $150 to $200. So far there is no difference in price of milk in city markets, pasteurized or unpasteurized. Large dairies have established pasteurizers more for their own protection, especially as this process insures keeping of the milk. Some physicians have claimed that pasteurized milk is not so digestible as perfectly fresh, clean milk. We believe the certified milk dairies do not pasteurize.

According to the ordinance regulating production and sale of milk in the city of Los Angeles, "Pasteurized milk is milk that has been heated above 145 degrees Fahrenheit, and maintained at or above such temperature for not less than 20 minutes, and immediately cooled to 70 degrees Fahrenheit, or lower, and maintained at or below 70 degrees Fahrenheit at all times prior to delivery thereof to a consumer or consumers." Pasteurized cream is the same as the above excepting that it requires not less than 20 per cent of fat and not less than 9.8 per cent of milk solids.

Compensation for Condemned Animals.

I note the Cultivator has raised the question of the state paying for animals condemned because of tuberculosis or other infectious diseases. I wish to state that this can be done and has been successfully in at least one eastern state. The state from which I came paid for all animals condemned by veterinarian. The fund for this purpose was raised by taxing dogs $5.00 a head. The limit paid for condemned stock was $25 for cow or steer and from $10 to $100 for horse. The state furnished a collar with tag riveted on for dogs and collector was allowed five per cent of his collections. All dogs without collar and tags were killed.—Subscriber.

We did not know that eastern states devoted this dog tax fund to compensation for different farm animals. Some states we know do use such fund for compensation for sheep killed by dogs. In such case the sheep men present claims for animals killed in county where injury was done and full value for the sheep is allowed.

Stomach Staggers.

Have been feeding young calves on milk and oil cake. They seemed to thrive for a time, but recently one or two began to get thin. Discovered lice on them and washed them in strong tobacco tea. As soon as fed they begin to stagger and get weak, sometimes bloat. They seem to have stomach trouble. Is this from lice or is it some disease in the herd? Have raised calves before on oil cake and they did well.—Subscriber, Lompoc.

These calves seem to have stomach staggers caused by overfeeding on rich food. If whole milk is used, oil meal is not needed. If skimmilk is used a tablespoonful of oil meal to each quart is sufficient. Only feed until calf's sides are level full, not until they stand out. A dairy calf is rarely fat and is not intended to be so. This deceives many who do not realize that a calf can carry a large amount of internal fat and yet appear thin compared to the more rotund beef calf.—M. E. S.

Morning Glory.

Can you give me spray which will kill morning glory by spraying once a week during the growing season? Have several patches in vineyard which seem to be spreading.—Subscriber, Lodi.

Would refer subscriber to the issue of the Cultivator of June 16th in which is an article, "Various Chemical Methods of Killing Weeds," by Mr. Malvern W. Iles. Mr. Iles states that distillate sprayed over the growth to be killed, especially if done in the heat of the day, is very effective. He also refers to the use of a strong solution of sulphate of copper and sulphate of iron. Strong brine, if hot, is also good, but with this one must be careful that the soil is not poisoned for the vines. The best cure is thorough cultivation. In vineyard, however, this is almost impossible during the summer season.

Washing of Soil.

What is it about my soil that makes it wash so easily? Is it lacking in humus? If so, how may this condition be remedied?—Subscriber, Covina.

Humus or vegetable mold is a binder of soils and the more of it the better. California climatic conditions are very hard on soils in burning out the humus rapidly, thus necessitating greater care in preserving this essential ingredient. Of course, a very light sandy loam is hard to keep from washing, but care in planting of cover crops on such soils, which will grow during the storm season, thus binding by the growing roots, will also enrich it and add humus when plowed under after the rainy season is passed.

Minorcas.

I notice that of the Minorcas most people prefer the black to the white. Is there any reason for this other than individual fancy? Do the White Minorcas equal the black in every way? The weather is very warm here in summer, often 100 degrees to 103 and 104 degrees, and higher has been reached infrequently. In such a climate would a white fowl do better than a black one on account of black attracting heat or does it make any difference where fowls have plenty of shade? All other things being equal will a Minorca make one and one-half pounds to two pounds as quickly as a Leghorn, and are they considered their equal as to tenderness of meat? Do the Minorcas compare with the Leghorns as layers, and being a larger bird, does it take appreciably more to feed a large number than it would the same number of Leghorns. I notice that here in California the majority of poultrymen keep Leghorns. Is there a good commercial dollar and cent reason for this, and if so, please "show me."

I am thinking of going into the poultry business in a small way in conjunction with my other farm work and as "well begun is half done," I want to be reasonably sure that I am on the right track before I venture. —L. A. K., Gridley.

We do not know cause for the general preference for Black Minorcas other than that they are considered hardier. The Blacks have been in existence for more than a hundred years, originating in Spain; the Whites are sports and do not seem to have the characteristic vigor of the

Blacks. As to standing heat, we do not think there would be material difference, or if a preference is to be expressed, ours would be with the Blacks on that score. We recognize the contention of the inquirer that black absorbs and white reflects heat, but notwithstanding that it is a fact that black hogs will thrive in the hot interior valleys, while the white ones blister and burn until their breeding has been almost entirely discontinued in the interior valleys of California. Every fair-skinned human being shows the same susceptibility to heat, while the darkey revels in it. On the other hand if fryers are to be produced, the white would perhaps be preferred as they dress cleaner, their flesh is whiter and their shanks have a more attractive look.

We think Minorcas would lay on flesh as broilers as rapidly as the Leghorns; as layers they would probably average nearly with the Leghorns, though many consider the Leghorns the very best. As to showing the inquirer why California poultrymen prefer the White Leghorn, we cannot give space necessary to make such proof. We may mention, however, that the White Leghorn lays liberally of white eggs, and white eggs command a slight premium in the San Francisco market, though the Los Angeles market makes no distinction. Of course, the white egg is a feature of the Minorca as well as the Leghorn. Minorca eggs are the larger, and if the effort to compel selling by the pound should succeed, the Minorca might prove as profitable as the Leghorn.

Lippia.

Please tell me if lippia is desirable for lawn purposes, or has it the same tendency to spread as Bermuda and Johnson grass?—Subscriber, Turlock.

Lippia is one of the most satisfactory lawn coverings for hillside or for sections where supply of water is limited. Of course there is no grass that gives results like blue grass under proper conditions. There is no danger of lippia becoming a pest. It spreads very rapidly, but it does not have the persistency of Bermuda and it is comparatively easy to eradicate.

Grafting Wax.

Please give formula for grafting wax.—Subscriber, Orange.

Into a kettle place one part by weight of tallow, two parts of beeswax, four parts of rosin. When completely melted, pour into a tub or pail of cold water, then work it with the hands (which should be greased) until it develops a grain and becomes the color of taffy candy.

Standard of Perfection.

Where can I secure copy of Standard of Perfection?—Subscriber, Santa Rosa.

The Cultivator office can secure the new Standard for you at $1.50, or you can secure it from almost any poultry supply house.

Worms in Chickens.

What is best to give chickens for worms?—Subscriber, Colusa.

Perhaps one of the best and safest remedies is Humphrey's Specific, the same as used for humans. It is said to work perfectly given in same dose as for child.

Paint for Wagons.

What is the best cheap paint for farm wagons and implements?—Subscriber, Whittier.

Probably the best durable paint for wagons and implements is red lead and oil. With oil at present prices it can hardly be called cheap, yet quality and all considered it is probably the cheapest. There is one objection to this paint, however, in that the red of the lead is not very permanent. In the sunshine it soon fades to a reddish "brindle." When one takes into account the time required to thoroughly clean a wagon for painting and the quantity of paint required, the best grade of mixed paint is not really expensive. Such paint would have our preference unless an expert mixer can handle the preparation.

Spraying Cherries and Prunes.

I have recently located here on a fruit ranch and will appreciate information as to spraying of cherries and prunes; also formulas for solutions. Do grapes need sulphuring in this location, and when?—Subscriber, Los Gatos.

We would refer our subscriber to the Cultivator of November 3rd. The sulphuring of grapes would be necessary to secure a fair setting. Make application of high-grade sulphur around vines at time of blossoming, or spray before vines start, as suggested in November 3rd issue.

Stock at Large.

If A has stock running at large and B has unfenced crops which are injured by A's stock, is not A liable?—Subscriber, Los Angeles.

Under the present law A is not liable. This is contrary to reason and to the usual belief. It is now thought that the present legislature will amend this law so that stock owners must fence their stock.

Pumpkin Seed for Chickens.

Will pumpkin seed added to the chicken feed occasionally, be beneficial?—Subscriber, Watsonville.

We would not feed extensively of pumpkin seeds, but know that raisers of dairy cows consider them beneficial in limited quantities. The claim has been put up that they are injurious and should be taken out of the pumpkins fed, but this has been proved unfounded.

Bourbon Red Turkeys.

Can you tell me the name of a breed of turkeys with red plumage, and where can eggs be had?—Subscriber, Los Olivos.

We presume our subscriber refers to the Bourbon Red, but we do not know of any stock in this state. There have been several inquiries of late regarding these turkeys, and if any of our readers have eggs for sale, they would probably get good results from use of the advertising columns of the Cultivator.

Temperature for Olives.

What is the lowest temperature the Mission olive will stand? Is it a self-pollenizer? If not, what is the best associate and what percentage of the pollenizing trees should be used?—W. T. F., Orland.

The temperature at which any tree or fruit is injured depends so much upon other conditions that it is hard to answer. It is stated that the olive tree has survived a temperature of 14 degrees Fahrenheit in this state, but while this may be true of a fully grown tree, it is also true that a temperature slightly below freezing in the fall at the time when the fruit is ripening, will cause it to shrivel and make it of a low grade or even worthless. Therefore, if fruit is removed before the frost comes and the trees have attained a reasonable size, they will carry through the cold season and possibly show a full crop next spring even if low temperature is encountered during the stormy season.

The shyness of bearing of which the Mission has been accused has been

H. M. SANBORN, 517 14th St., Oakland, Cal.

Walnut Grafting Wood

For highly productive resistant trees.

J. B. NEFF, : : : Anaheim, Cal.

A few turkeys, well cared for, are more profitable than a large number when you have had little experience in raising turkeys. Turkeys are not difficult to raise when one knows how to raise them. The beginner is apt to meet difficulties.

ascribed to lack of proper pruning, lack of sunshine when trees are closely set, and lack of pollinating. For the latter reason many have interset an occasional tree of other varieties. When that is done it should be of a variety blossoming at same time as the Mission as nearly as possible.

Duck Questions.

In brooding ducklings must they have a light at night? Will they do better with heated or fireless brooders? Should breeders have a light? Will milk displace meat in the mash, or should both be given? Should birds intended for breeders be fed differently from those in fattening pen? —J. B. G., Merced.

The question of fireless brooders is one in which there is great difference of opinion; some of widest experience prefer them; others have failed with them, and insist that, especially with younger chickens and ducklings, heat is necessary. We do not think there would be any necessity for light in brooder, and but few duck raisers use them in breeding pens. Where there is no light ducks sometimes become frightened and stampede, rushing from side to side of the pen until some are trampled to death. In placing a light in the pen it is always necessary to be very careful, for the swinging of the light, causing shadows to move quickly, seems to drive them wild. Milk will not entirely take the place of meat, although it is a fair substitute. For eggs, the following ration has been recommended for feeding every morning and evening: 5 parts corn chop, 5 bran, 2 middlings, 1½ beef scraps, 3 boiled vegetables, 3 cut green stuff, 5 per cent sand. Wet to crumbly state. For fattening feed the following morning, noon and night, being careful to leave none of the uneaten feed where birds can get it between times, or they will glut their appetites: 2 parts corn meal, 2 middlings, 1 bran, 1 green stuff, 10 per cent scrap, 5 per cent sand. Wet with water to dry, crumbly state.

Measuring Flow of Well.

Please tell me how to figure number of miner's inches my well flows. I made a weir with 18-inch outlet, and the water stands 4¼ inches deep back from the outlet three feet.—Subscriber, Oxnard.

We would refer the inquirer to page 531 of the issue of May 6, 1909, which will give drawings and tables that will enable him to determine the amount of water his well is flowing. It is impossible to say from the facts given in the question. By saying the "water stands 4¼ inches deep" does the subscriber mean that from a point exactly on the level with the top of his weir the water stands 4¼ inches deep? If that is the case, then the table will enable him to determnie the flow with accuracy.

Worms In Gizzard.

In dressing chickens I have found fine, hairlike worms from a half to three-fourths inch long in gizzard. What are they, and what is treatment? —M. W. W., Stockton.

Probably turpentine is the best remedy for this trouble. A teaspoonful in one quart of water thoroughly stirred and used to mix with the soft feed, also same amount with the drinking water, will prove beneficial. Above all, spade the ground or keep droppings out of the runs. The infection may come from unclean or spoiled food or from droppings of pigeons or other birds to which the poultry may have access.

A system of irrigation just completed in Lassen county will irrigate 4000 acres of Honey Lake Valley land.

Veterinary

Answers in this column by Dr. Fred G. Matthews, are without charge. For immediate mail answer remit $1.00. In writing questions give full symptoms or particulars of injury of animal.

Warts.

A two-year-old heifer has a wart as large as a hens' egg over her eye and a number of smaller warts on the side of the face. A younger heifer is getting warts all over her head. The heifers run on low land and drink well water.—Subscriber, Hanford.

The cause of warts is a question not yet settled. Use rubber elastics to remove the large warts if their form will permit. Mix sulphur and castor oil to make a paste and apply to the warts.

Bladder Trouble.

A horse, ordinarily in good condition, begins to manifest bladder trouble about two weeks after he is started to regular work in the spring. He attempts to urinate four or five times in an hour and when he finally succeeds several tablespoonfuls of mucus is passed. He is fed oat hay and rolled barley but eats anything with a good appetite. Soon after he starts to work he becomes weak and thin.—Subscriber, Sacramento.

The symptoms indicate inflammation of the lining of the bladder. Have your druggist prepare 16 powders, each containing powdered buchu, one ounce, belladonna one drachm, potassium acetate half ounce, and potassium iodide half drachm, and give one powder twice daily in the feed.

Red Mange.

A dog has what I think is mange. The skin of the body appears to be thick and red and the disease has been spreading during the past seven months. Is this mange? Kindly advise some powerful medicine which will give the poor animal immediate relief.—Subscriber, Pasadena.

A microscopical examination would be required to determine if this is mange or eczema, but in all probability it is follicular mange, the form of mange most difficult to cure. Relief will be accomplished slowly, at best, and after vigorously applying strong remedies. Mix chloroform one ounce, creolin two ounces, and denatured alcohol five ounces. Shake and apply once every third day.

Pustules on the Udder.

A cow has little boils on the udder and they seem to affect the milk flow. They have been coming and going for four months.—Subscriber, Waukena.

Place two teaspoons of pure carbolic acid in a four ounce bottle and add camphor gum till some camphor remains undissolved. Apply liquid thus formed to the inflamed spots and also rub it into the pustules after all matter has been pressed out.

Mange or Itch in Horses.

Tell me the cause of my horses itching over the neck and shoulders. They try to move the barn rubbing themselves and they try to scratch with the hind feet when I curry. There are no lice on them. Blotches may be felt under the hair, but I can find only a little dandruff on examination.—Subscriber, Porterville.

The fact that more than one horse is afflicted and the symptoms given leave little doubt that the sarcoptic mange parasite is the cause of the itching. This disease is sometimes transmitted to man. Scrub the parts thoroughly with soap and water, dry and apply every third day, liquid sulphur and raw linseed oil, equal parts, shaken together.—F. G. M.

Legal

Edw. L. Payne, attorney, 301-304 Douglas Building, Los Angeles, will answer legal queries in this department.

Immediate mail replies cannot be given except where fee to Mr. Payne is paid. When replies are wished in Cultivator address query to 115½ N. Broadway. Los Angeles.

Drawing a Will.

A man in California, dying, leaves a wife and children, but no will; how will the courts distribute his property, what will be the wife's portion if all is community property? What if the property left is in Minnesota?

What is the shortest and simplest form of will where a man desires to leave his undivided one-half of his property to his wife during her lifetime, that is, the income, the same to be equally divided among the children after her death. Need the children be mentioned by name? Can it be provided that the wife be executrix without bonds and without interventions of any court?—H. E., Garvanza.

If all of the property is community property, the wife takes one-half of the property left in California; if all of the property is separate property, the wife takes one-third and the balance is divided equally among the children. I have not examined the Minnesota law and have not the time to make an examination for the purpose of this answer.

The shortest and simplest form of will is one written, dated and signed by the testator. Every portion of it must be in the hand-writing of the testator, and in this particular instance could be about as follows:

"I.....give, devise and bequeath to my wife....., an undivided one-half interest in and to all of my property of every kind and description wheresoever situated, during her lifetime, to have, use and enjoy the income therefrom during her natural life, and I hereby give, devise and requeath all of the said property remaining at her death among my children, equally" (naming them).

The children need not be mentioned by name, but unless you anticipate additions to your family, it would be wiser to do so, as then the parties who take will be identified. You can provide that the wife shall be executrix without bonds, but it is impossible that she act without the intervention of any court. The law requires all estates to be probated. If you do not wish your estate to pass through the probate court, you can give it away before you die, but you must give it away without any strings upon it, and not merely for the purpose of evading the law.

If you contemplate making a will, it would be far better for you to consult some lawyer in whom you have confidence than for you to endeavor to draw it yourself, even with the help of these instructions. It is seldom that a layman makes a good job of this kind.—E. L. P.

Stock Killed by Train.

Is a railroad liable for stock killed by their trains on unfenced track within a forest reesrvation on which the owner of said stock holds a government permit to graze?—J. E. Y., Lang.

The statute provides a penalty for killing or maiming cattle or domestic animals on a line of a railroad which passes through or along the property of the owner thereof, without regard to the manner in which the train may be operated, (and provided the injury is not due to any neglect or fault of the owner of said animals) unless the company fence its line of road. If the railroad company pays the owner the price of making or maintaining a fence, then the company is relieved from all claim for such damage, and on the other hand, the owners of such animals are responsible for any damage or loss which may accrue to the company from such animals being on the railroad track resulting from want of such fence when the company has paid for the same as provided in the statute. The fact that the land is government land, and that the owner of the stock is a mere licensee of the government, might make some difference in the right to recover. My offhand opinion is that if the owner of the stock can show the right to occupy or pasture government land, under permit from the government, that the same rule would apply as though he owned the land through which the road runs.—E. L. P.

Filing on Water.

Water rises in forest reserve and flows on private property where the owner's stock has had use of it for many years, but the surplus has been allowed to waste on surrounding land without any effort to use in irrigation. Can a filing be made on this water by parties not owning this land on which the water has wasted, but owning below where this waste would have great value? If the owner of land where the water is now wasted is entitled to the right of stock watering, but to no irrigation supply, can the surplus (over and above stock requirements) be filed on if troughs and automatic floats protect stock supply?—E. L., City.

A filing may be made by any one for beneficial use upon land to which the watershed is tributary. The surplus, over and above what has already been appropriated, is all that can be filed upon, and, of course, the one filing later would not be permitted to interfere with the method of taking and use of the prior appropriator. It matters little what method is adopted by the later comer, so long as he does not interfere with the rights of the other party or parties.—E. L. P.

Eucalyptus on Line.

Is there any law to compel a person to remove eucalyptus trees planted right up to the division line?—I. W. F., Los Angeles.

There is no law compelling a person to remove trees, unless they are infected. If the trees are planted so close to the division line that their branches or roots extending over onto a neighbor's land cause him inconvenience, he may cut off the branches or roots, but he can't compel owners of the trees to do so.—E. L. P.

Statute of Limitations.

What is Statute of Limitations on farm labor? How long after services were completed will debt outlaw?—Subscriber, Ramona.

The debt outlaws in two years where the obligation arises upon a contract not founded on an instrument in writing, unless the action is upon a mutual open and current account, or upon an open book account. Upon a mutual, etc., account, that is, an account in which each party has charges against the other, or upon an open book account, the statute of limitations is four years.—E. L. P.

Recording Mortgage.

A makes deed of trust to B to secure a loan. Must A pay recording fees for same, when no stipulation had been made to that effect.—Subscriber, Arroyo Grande.

No, it is not customary for A to pay the recording fees when he makes trust deed or mortgage to B, but it is frequently agreed that A will pay such fees.—E. L. P.

California Cultivator Clubbing Price List

FOR THE SEASON 1910-'11

Prices are Good to Oct. 1, 1911

This magazine price list is prepared annually for the convenience and benefit of Cultivator subscribers. The prices given allow our readers the benefit of the lowest figures possible, in return for which, all we require is that to all orders a year's subscription to the Cultivator (class 18) be added at 90c (regular price $1.00 per year).

This year the pricing of various combinations of magazines is a simple matter; all are listed according to class number and this class number multiplied by 5 gives the cost price.

EXAMPLE:

Class No.		Regular Price
20	American Magazine	$1.50
16	Delineator	1.00
37	World's Work	3.00
18	Cultivator	1.00

91X5=$4.55. Club price for all. Amount saved on this club, $1.95.

We desire to especially call attention to this complete list of the most popular magazines. We can, however, supply any periodical published, at the lowest price, and any not listed here will be quoted on request. Let us make you a price on any combination you may desire.

Periodicals in any combination may be ordered to the same or different addresses. Foreign or Canadian subscriptions are extra on account of added postage and prices must be gotten by correspondence. Subscriptions may be either "new" or "renewals," but it is important that this information be given in each case.

Books—Send us a postal for our list of agricultural books which we supply subscribers and which we recommend as most suited to California conditions.

Don't overlook this special:

The California Cultivator (weekly)---
The Rural Californian (monthly)---- } Both one year for $1.50

Our Money-Saving Combinations:

The price of the Cultivator and any single magazine may be obtained by adding 90c to the class price of the magazine desired.

Make up your orders from the following, noting that the class numbers multiplied by 5 gives the cost price. Also bear in mind that **all orders must include a year's subscription to the Cultivator (class 18) at 90c.**

Krogh New Type Vertical Water Balanced Pump

This Pump

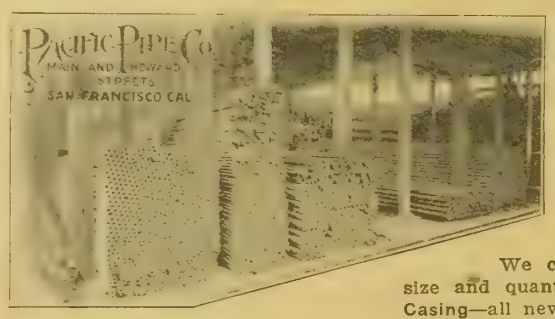
Will Interest the Irrigator

Pump has Water Sealed Gland, Enclosed Balanced Impellor. Will not cut out by sand. Can be placed in a smaller pit than any other pump. Our Bulletin, C12, tells all about it. The pump can be seen in operation at our places of business. We have a permanent branch house at

206 No. Los Angeles St., Los Angeles

Krogh Mfg. Co.

149 Beale St. San Francisco, Cal.



Save Money By Buying This Good Second-Hand Pipe

We can supply you with any size and quantity of **Standard Pipe or Casing**—all new threads and couplings—all stock guaranteed first-class.

If thinking of buying any kind of pipe, your best interests will be served by writing us for prices and particulars.

PACIFIC PIPE CO., Main and Howard Streets, SAN FRANCISCO.

EUCALYPTUS TREES

Large quantity, extra quality to select from. **ORANGE and LEMON TREES,** A. 1 quality, A large assortment of **PALMS.** Orange Seed Bed Stock, Sour and Sweet.

Our trees guaranteed best grade, true to name. Our long experience is a guarantee of our reliability. We especially call attention to our large stock of **EUCALYPTUS TREES.**

COVINA NURSERIES

312 BYRNE BUILDING LOS ANGELES, CAL.

EUCALYPTUS TREES

We offer a large stock of the tree that made San Jose famous—the tree of the sudden saw log—the tree that will yield you an income as long as time shall last. The genuine Blue Eucalyptus; also the red gums Rostrata and Tereticornis.

Roses, Roses—all the leading kinds. Acacias, Silk Oaks, Peppers, Dracaenas, Hedge Plants, Fruit Trees. Black Walnut Seedlings cheap.

Giant Himalaya, Loganberry, Superlative and Yellow Antwerp Raspberries.

The "San Francisco," a veritable giant among strawberries.

Prices right. Lists mailed free. Correspondence and inspection invited. Wholesale and retail. Write and see if we are not a LIVE WIRE.

Irrigation and Forestry

JARRAH.

In the issue of The Cultivator of October 13th was a communication from Mr. J. Blackburne of Maryborough, Victoria, upon Eucalyptus marginata, more commonly called the Jarrah. This communication was brought out from Mr. Blackburne because of statements made in The Cultivator that these trees had not done well in this state. These statements still stand and Mr. Blackburne made no contradiction of them, only he wished it known that in certain sections of Australia the Jarrah is a magnificent tree. There was so much of interest in that article that we reprint much of it below and call attention of our readers to illustration on cover page of this issue which shows photograph taken in an Australian forest.

* * *

"As I noticed recently statements in The Cultivator asserting that this unrivalled species does not flourish very well in California, it has occurred to me that there must be a reason for this non-success. It may be that the planting has been done in unsuitable soils and localities.

"Before dealing with this aspect of the question it may be as well to consider the tree in its native habitat in Western Australia. According to the great authority on eucalyptus, the late Baron von Mueller, it is found from 'King George's Sound to Cape Leeuwin and the Moore River, forming the principal forests in Southwestern Australia and occupying a region not far removed from the coast. The Jarrah in its humid native region seems more indifferent to soil and situations than most other eucalyptus, but it avoids hot and dry tracts of country. I saw it descend (in a stunted form) on sandy ridges and calcareous declivities close to the sea shores, and traced it, as a shrub, to the rocky summits of the Sterling's Range (nearly 3000 feet high). But its development for extensive timber forests takes place on the ranges of older rocks well within the influence of the sea air, as shown on the forest map issued by the Hon. Malcolm Fraser, Minister of the Lands Department of Western Australia. Throughout nearly the whole region of its range the Jarrah is largely mixed with Calophylla (the Southwest Australian Red Gum or Bloodwood tree). Marginata is not a tree of rapid growth and therefore not one of early regeneration either. The choicest timber is obtained from the slopes of the granite and iron-stone ranges which are within the influence of the prevailing moist southwestern summer winds.' Baron von Mueller also expressed an opinion that the development of the Jarrah would be more rapid in moderately elevated mountains than in flat country.

"Mr. Blair, superintendent of the Yan Yangs forest plantations at Lara, Victoria, planted some Jarrah there seventeen years ago. He informs me that some of the trees are doing remarkably well. He thinks they should be put in about ten feet apart and thinned out subsequently to twenty feet, as they are a bold, strong growing species and appear to require plenty of room. The trees at Lara have attained a height of from 30 to 35 feet, with a stem girth at two feet from the ground of two feet nine inches. The soil they grow in is poor, and the rainfall rather light, but the plantations are near the sea, only a few miles inland.

"It may be presumption on my part to assume that the Jarrah has not been planted under favorable natural conditions in California. Perhaps it has, and has failed to succeed as a forest tree, but I still think until I am assured to the contrary, that plantations in rangy country with a good natural rainfall, not too far inland, on deep granite or ironstone soils, ought to give satisfaction. All our best timbers here, like the Ironbark (E. Sideroxylon), Grey Box (E. Hemiphloia), and the Jarrah (E. Marginata) are slow-growing trees, producing for that reason unrivaled hardwoods, and it cannot be expected that the Jarrah, even in a country like California, will grow with the celerity of the Bluegum or Sugargum."

* * *

In a later letter, answering questions which we sent him, Mr. Blackburne writes:

"You ask me amongst other things if Australia is doing any commercial planting of trees in a large way. We in Victoria are not doing much yet beyond a few hundred acres of pines, acacias, and eucalyptus, and the other states have not, with the exception of South Australia and New Zealand, made much headway with planting. Our native forests are not exhausted yet and when the original is cut down seedlings come up like a crop of wheat and only require thinning and regulating to form a good forest again.

"In establishing young eucalyptus forests I have had considerable experience and always prefer to sow the seed broadcast instead of planting the young trees. When the seedlings come up (we sow in July) and attain a height of a few inches, say about March the following year, they are thinned out to a distance of seven or eight feet apart and allowed to stand for a few years until thinned again for commercial purposes. We do not water or irrigate under this system, but depend upon the natural rainfall (22 inches). We principally sow Bluegum and Sugargum. Eucalyptus raised in our nurseries for free distribution are sown in seed beds in the open and potted off into three-inch pots."

* * *

Von Mueller's "Select Extra-Tropical Plants" says: "The Jarrah or Mahogany-tree of Southwestern Australia is famed for its indestructible wood, which is neither attacked by

chelura, nor teredo, nor termites, and therefore much sought for jetties and other structures exposed to sea-water, also for any underground work, telegraph poles, and largely exported for railroad sleepers. Vessels built of this timber have been enabled to do away with copper-plating. For jetties the piles are used round, and they do not split when rammed even into limestone or other hard foundations, provided the timber is of the best hard kind."

Notwithstanding all these magnificent qualities of the timber it must be admitted that this tree has never succeeded in California and doubtless will not because of soil and climatic conditions.

GRAZING EXAMINERS FOR NATIONAL FORESTS.

A new government position is disclosed by the announcement by the U. S. civil service commission of an examination which will be held February 23 and 24 to find three grazing examiners for the forest service. The positions will pay a salary of $1200 a year at entrance.

The announcement specifies that the applicants must be men, at least twenty years old, and possessed of at least one season's experience in handling range stock, together with at least one year of technical training in specified botanical studies.

The establishment of this position is in line with the objects which the department of agriculture has always had in view in its management of grazing on the national forests. It is not merely seeking to prevent cattle and sheep from doing damage to forest growth and watershed conditions, as they graze on the herbage which is yearly produced in the open forests, parks, and high mountain meadows within the national forests. Range-fed stock are a matter of decided importance to the American people in these days of rising prices for food products and diminishing supplies, in proportion to population, of livestock; and therefore Secretary Wilson intends that every acre of national forest range shall be made to produce as much forage as it is capable of doing, consistently with the carrying out of the other purposes for which the national forests are maintained.

Ever since the forest service took over the management of the national forests, it has been studying the range problem along with its regulation of grazing. In the beginning it was confronted with the fact that a very large part of the range had been badly abused and depleted through the competition of rival owners before any restrictions had been put upon them, and by overcrowding and bad methods of handling stock. Its supporting power had in consequence been greatly reduced, and was steadily declining. To enable overgrazed areas to recuperate, and to prevent the extension of overgrazed conditions to new areas, the amount of stock to be allowed on the forests was everywhere carefully prescribed. The results were then observed, and if it appeared that there was still over-use of the range, the numbers permitted were cut down still further. On the other hand, where recuperation has taken place the allowance of stock has been correspondingly increased.

The proposal to appoint specialists who are both thoroughly trained botanists and men of practical experience in range matters indicates recognition of the fact that to attain the highest

(Continued on Page 219.)

Deep Well Pumping For Irrigation.

The past season has demonstrated more than ever the practicability and superiority of the Pomona Deep Well Pumps. It is fully proven that it is possible to lift large quantities of water from very deep wells with a surprisingly small amount of power. It has usually been considered that a plunger pump is only good for a 35-inch stream on a lift of say 200 feet, but the Pomona Manufacturing Company have demonstrated that it is no longer necessary to use a centrifugal pump, with its wasteful usage of power, to get a large quantity of water out of the ground, as this company is manufacturing extra large size cylinders including 12, 13, 14 and 16 inches in diameter, and capable of lifting from 50 to 100 miner's inches of water. Not only that, but they are prepared to go down after it to depths of 300 and 400 feet if necessary.

They have one plant at Claremont where the water stands 390 feet below the surface and the pump has a total lift of 450 feet, delivering 45 miner's inches of water with 60 H. P. on the motor, and doing it easily. There is another plant in Ontario lifting 60 miner's inches 300 feet with a 60 H. P. engine.

The parts below the surface have been so perfected that they are perfectly reliable and are giving as little trouble as it is possible for a machine to do. Other pump makers, noting the wonderful success of the Pomona Pumps, are trying to imitate them, promising something just as good, but they are only imitators and have not the knowledge or ability to make their claims good.

The Pomona Manufacturing Company has a large plant at Pomona, the only one in Southern California, devoted almost exclusively to manufacturing Plunger Pumps. They are a reliable establishment and are here to stay, to make good their guarantees and to supply your wants in the way of extras or assistance. Their machines and apparatus have been tried out and their value fully demonstrated.

Anyone needing pumping machinery should send to them for catalogs, or visit them in person.

A $15,000 levee is to be built along the Sacramento river in Butte and Glenn counties that will form an independent union levee district.

The Luitwieler Non-Pulsating Pumping System

Deep Well Pump Talk Continued:

Cut shown is of the Assembling Room of the Luitwieler Factory. Luitwieler Pumps are built in large numbers at a time with all parts interchangeable. The Luitwieler cam is the only mechanism applying the power uniformly throughout the full stroke, thus doing the same work with less power than any other method and with longer life of working parts.

Luitwieler pumps have worked steadily for eleven years without any repairs. The Santa Fe Railroad has 26 in use. Of course THERE'S A REASON. They give more economical and satisfactory results than any other way of lifting water. Pumps for every service. Thirty-four years' experience in Los Angeles.

Our Agents:
Clarence Murray, M. E., Fresno, Cal.
Porterville Engineering Company, Porterville, Cal.
Simonds Machinery Co., San Francisco, Cal.

Luitwieler Pumping Engine Co. Los Angeles

Are Your PROFITS DRYING UP?
FOR THE "LAND'S SAKE" Why Don't You Irrigate That Farm of Yours?
You don't need a Surveyor. Get a Bostrom Improved Farm Level and do the work yourself.
THIS LEVEL IS NO MAKESHIFT. The outfit includes Level, Telescope with magnifying glasses enabling you to read the target a quarter of a mile away; Tripod, Graduated Rod, Target, and Bostrom's 70 page book—"Soil Salvation"—giving the cream of 25 years practical experience in Irrigating, Draining and Terracing, with full instructions how to use the Level. Simplicity, Accuracy, Durability Guaranteed. Used and endorsed in every State in the Union, also Canada and Mexico. Price $15.00.
If not on sale by your local merchant, he will order for you; or you can write either of the following jobbers direct, who will see that you are supplied. Pacific Hardware & Steel Co., San Francisco or Los Angeles; The Thomson-Diggs Co., Sacramento; Hazard, Gould & Co., San Diego.

WICKS FOWL FARM, Moorpark, Cal

Business

GOOD NEWS FOR HORSEMEN.

It might be of interest to you and the general public, especially horsemen, that as a veterinary surgeon of 25 years' experience, I can safely recommend Gombault's Caustic Balsam to perform greater cures than advertised in your circulars. I use it in my every-day practice and could not get along without it. On coming to this territory two years ago, none of the druggists kept it, consequently I had them order a dozen bottles, and since that time I have never been without it. Many a track horse has gone to ruin by strained tendons when one bottle of Gombault's Caustic Balsam would have brought him out as nimble as a colt.—Wm. Buchner, V. S., El Reno, O. T.

It is with pleasure we call the attention of our many subscribers to the attractive ad of the Boesch Lamp Co. in this issue of the Cultivator. The vehicle headlight advertised by this firm, a cut of which is shown, is their own design and manufacture.

We have carefully inspected the factory in which these headlights are manufactured and feel justified in saying that it is the most approved and up-to-date plant of its kind it has been our pleasure to witness.

The great machines and many busy mechanics are constantly turning out headlights, lamps and lanterns of every description. The very best material is employed and each mechanic is skilled in his particular line.

Their vehicle headlight, when once used on the farm, around the barn and the dairy or as a driving lamp, would be considered almost indispensable. Besides being a very powerful light, its neatness and general appearance is a work of art, furthermore, it is home industry and is deserving of your patronage. We commend it to the readers of the Cultivator.

BABY CHICKS.

The Pioneer Hatchery's new 64-page book is free to all Cultivator readers who send their names and addresses. This is the largest book of its kind ever printed—64 full pages of useful poultry information. Just send your name to the Pioneer Hatchery, 112 East Eighth, Los Angeles.

A HEALTHY INCREASE.

650% increase in any business is certainly going some, but E. E. McClanahan, the Success Incubator man, reports sales for this January six and one-half times as large as last January. Full description of these famous incubators can be had by sending your name to E. E. McClanahan, 112 East 8th, Los Angeles.

The C. C. Morse Co. of 48 Jackson St., San Francisco, is sending to Cultivator inquirers a novel card folder with return postals, which is well worth the asking. It describes several novelties which the firm is specializing on and makes combination offers most attractive.

EGYPTIAN COTTON IN THE UNITED STATES.

Although the United States is the greatest cotton-producing country in the world, a large quantity of this staple is imported from Egypt every year. The variety of cotton most extensively grown in Egypt is known as the Mit Afifi; it has a soft, rather crinkly fiber of a characteristic light brown color that renders it especially useful for certain classes of cotton goods in which the natural color of the fiber is retained.

The best Egyptian cottons bring a price second only to that paid for the highest grades of Sea Island, being used solely in the manufacture of the finest goods. They are especially suitable for mercerizing, taking this process better than the native American cottons, and are largely used for mixing with silk and for the manufacture of cloths in which a high finish and luster are required. In 1909 the import of cotton from Egypt amounted to 72,617,893 pounds, valued at $12,101,000.

In view of the considerable value of this import, the U. S. Department of Agriculture is endeavoring to develop Egyptian cotton culture in the United States in order to supply the American market with a home-grown product. As a result of experiments that have been carried on for the past seven years in acclimatizing and breeding Egyptian cotton in the Southwest, several distinct types have originated from the stock of imported seed of the Mit Afifi variety with which the work was begun. Two of these are as distinct in the characters of the plants, bolls, and fiber as some of the newer varieties which have originated in Egypt from the Mit Afifi. A third promising type is an improved acclimatized strain of Mit Afifi rather than a new variety.

A description of the leading characteristics of these promising varieties and strains and the methods followed in the plant-breeding work, as well as a brief account of the general progress of the acclimatization experiments with Egyptian cotton during the year 1909, is given in Bulletin 200 of the Bureau of Plant Industry, entitled "Breeding New Types of Egyptian Cotton," recently issued by the U. S. Department of Agriculture.

Spinners who have examined samples of the acclimatized Egyptian fiber grown last year in the Southwest pronounce it to be in every way as well adapted to their requirements as is the imported cotton of corresponding grades.

A new disease of the skin known as "straw itch" has been reported. The cause is a minute parasite which preys upon larvae of insects infesting grain, especially wheat. Outbreaks of the disease have been noted in New Jersey, Maryland, Pennsylvania, Illinois and Indiana.

This little parasite remains on the straw and may attack persons who handle the grain or straw. When the straw is used for filling mattresses, those sleeping upon such beds are liable to contract the disease. Symptoms: Within twelve to sixteen hours after exposure the first and invariable symptom, itching, appears. The eruption appears at the same time as the itching and consists of wheals surmounted by vesicles. The contents of the vesicles soon becomes purulent. In severe cases there may be chills, nausea and vomiting. The eruption is most abundant on the trunk, slight on the extremities and practically absent from the face and hands.

The parasite is short lived, and if exposure is not repeated the disease soon subsides. In many instances, however, the cause not being known, the exposure is repeated many times. The treatment consists in removing the cause of infection, and for the attack the application of some mildly alkaline wash, some simple ointment, and in some cases a weak sulphur ointment.—Farm Journal.

PAN BROILING.

It is sometimes inconvenient to broil over the coals, and nearly the same effect may be obtained by cooking in a dry, hissing hot frying pan. Heat the pan to a blue heat and with a perfectly smooth pan no greasing is necessary. Sear the meat quickly on one side, then turn with a broad knife—without cutting the meat—and brown the other side before any juice escapes into the pan. Cook from 4 to 8 minutes, turning often enough to prevent burning, and add a sprinkling of salt before the last turning.

GRAZING EXAMINERS FOR NATIONAL FORESTS.

(Continued from Page 217.)

point of range productivity the best scientific knowledge must be applied to the study of the problems of forage production and utilization. As stock graze on the range, the effect on the different kinds of vegetation differs both with its palatability or unpalatability and with its capacity to produce seed, its time of seeding, its resistance to trampling, its manner of growth, and many other elements.

What is aimed at now is nothing less than to find out all the things on which depend the production of the largest amount of beef, mutton, wool, and hides on a given area. This involves learning how both to restrict and to time the grazing so as not to interfere with the reproduction of the most valuable elements in the forage crop, how to prevent unnecessary loss to feed through trampling and in other ways, how to exterminate poisonous plants from the range, how to prevent the loss of forage which results from the multiplication of prairie dogs and gophers, whether it is practicable to introduce new forage plants by direct seeding, and many other matters. It is to look into such matters that the grazing examiners are to be appointed.

Besides seeking to bring about the recuperation of depleted ranges, the reduction of waste, and the development of all range to what may be termed an artificial state of productiveness through control of reproduction, accompanied, it is hoped, by the introduction of new forage plants, the studies planned will aim also at increasing the area of range available. There is much natural grazing land in the national forests which can not be put to use, either because the country is too rough for stock to be driven in, because shipping facilities are lacking, or because of a lack of water. The construction of properly located roads and driveways and the development of water through the building of reservoirs or the driving of artesian wells are a part of the general scheme of permanent improvements planned for the national forests. To furnish the basis for comprehensive development of the grazing resource the range will be studied in detail, classified according to the type of vegetation found, and mapped by "forties." The observations made will include notes for each forty acres upon the surface, soil, character and density of vegetation, evidence of overgrazing or underuse, presence of poisonous plants, damage by range-destroying animals, water facilities, and accessibility. With such data in hand it will be possible to bring about much more intelligent and intensive use of the national forest range.

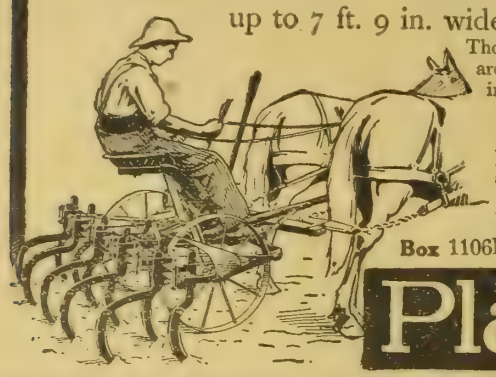
CABBAGE SALAD.

Cut in halves a small solid cabbage and place in cold salt water with the inside down, for half an hour. Drain and shave fine. Make a cream dressing by mixing two teaspoons sugar and one each of salt and mustard, using also a little pepper. To this add three-fourths cup cream, one lightly beaten egg and a half cup of vinegar. Cook over hot water until the mixture begins to thicken and add a teaspoon of butter. Beat well and allow it to become thoroughly cold before adding to the cabbage.

The flood waters from the recent storm damaged the Peoples Ditch weir in the Kings river. It will be repaired before the irrigation season.

Orchardists' Time and Labor-saver

The Planet Jr No 41 Orchard and Universal Cultivator is the greatest implement ever invented for orchard, vineyard and hopyard. It does exactly what orchardists want it to do. Saves time, labor and money. The frame is heavy and substantial, high-carbon steel, and carries cultivator teeth, sweeps, hoes, furrowers, also disc-harrow attachment. Made in three sizes, cutting up to 7 ft. 9 in. wide at one passage.



Thousands of Planet Jr Cultivators are saving time and lightening labor in California and other fruit-growing districts.

We carry stock in San Francisco. Agencies in all principal Pacific Coast cities. Write for name of nearest agent; also for 1911 illustrated Planet Jr catalogue of 55 kinds for every farm and garden need. Free and postpaid.

General Household Notes

AULD LANG SYNE.

Should auld acquaintance be forgot,
and never brought to mind?
Should auld acquaintance be forgot,
and days of auld lang syne?
For days of auld lang syne, my dear;
for auld lang syne,
We'll take a cup o' kindness yet,
for auld lang syne.
We twa hae run about the braes, and
pu't the gowans fine;
But we've wandered mony a weary
foot, sin auld lang syne.

We twa hae paidl't i' the burn, frae
mornin' sun till dine,
But seas between us braid hae roar'd
sin auld lang syne.
And here's a hand, my trusty frere,
and gie's a hand o' thine,
And we'll take a right guid willie-
waught for auld lang syne.
And surely ye'll be your pint-stoup,
and surely I'll be mine;
And we'll take a cup o' kindness yet
for auld lang syne.

—Robert Burns.

JOSH BILLINGS ON "PHARMING."

Pharmin' (now daze) is pretty much all theory, and tharefore it aint astonishing, that a man kan live in a city, and be a good chancery lawyer, and also kno all about pharming. A pharm (now daze), ov one hundred akers, will produse more bukwheat, and pumpkins, run on theory, than it would 60 years ago, run with manure and hard knoks.

Even now it aint unkommon, tew see three, or four, hired men, on a farm, with three, or four, span ov oxen, all standing still, while the boss goes into the library, and reads himself up for the day's ploughing. If i was running a pharm (now daze) i suppose i would rather hav 36 bushels, ov some nu breed of potatoze, raized on theory, than tew hav 84 bushels got in the mean, benighted, and underhand way, ov our late lamented grand parents. Pharmin' after all, iz a good deal like the tavern bizzness, ennyboddy thinks they kan keep a hotel (now daze), and they kan, but this iz the way that poor hotels cum tew be so plenty, and this iz likewise what makes pharmin' such eazy, and proffitable bizzness. Just take the theory out ov pharmin, and thare aint nothing left, but hard work, and all fired lite krops. When I see so much pholks, rushing into theory pharmin,' az thare iz (now daze), and so menny ov them rushing out agin, i think ov that piece ov skriptur which remarks, "menny are called, but few are chosen."

I onst took a pharm, on shares miself, and run her on sum theorys, and the thing figured up this way; i dun all the work, phurnised all the seed, and manure, had the ague 9 months, out ov 12, for mi share ov the proffits, and the other phellow, paid the taxes on the pharm, for hiz share. By mutual konsent, i quit the pharm, at the end ov the year.

What i know about pharmin, aint worth bragging about, and i feel it my duty to state, for the benefit ov my kreditors, that if they ever expekt me tew pay 6 pense in the pound they mustn't start me in theoretikal pharmin employ.

If a man really iz anvious tew make munny on a pharm, the less theory he lays in the better, and he must do pretty mutch all the work hiss elf, and support hiz family on what he kant sell, and go ragged enouff all the time tew hunt bees.

I kno ov menny farmers, who are so afflikted with superstishun, that they wont plant a single bean, only in the last quarter of the moon, and i kno of others so pregnant with science that they wont set a gate post, until they hav had the ground analized, by some professor tew see if the earth haz got the right kind of ingredience for post holes.

The fakt ov it iz, that theorys, ov all kind, work well, except in praktiss; they are too often designed tew do the work ov praktiss.

Thare aint no theory in brakeing a mule, only tew go at him with a klub in yure hand, and sum blod in yure eye, and brake him, just as yu would split a log. What i kno about pharming aint wuth mutch enny how, but I undertook tew brake a kicking heifer once. I read a treatiss on the subjekt, and phollowed the direkshuns cluss, and got knokt endwaze, in about 5 minnits. I then sot down, and thought the thing over. I made up mi mind that the phellow who wrote the treatiss waz more in the treatiss bizzness than he was in the kicking heifer trade. I cum tew the konklushun that what he knu about milking kiking heifers, he had larnt by leaning over a barn yard fence, and writing the thing up. I got up from my refleshuns strengthened, and went for that heifer. I will draw a veil over the language i used, and the things i did, but i went in to win. That heifer never bekum a cow. This iz one way tew brake a kicking heifer, and after a man haz studdyed all the books in kreashun on the subjek, and tried them on, he will fall bock onto mi plan, and make up hiz mind, az i did, that a kicking heifer iz wuth more for beef than she iz for theoretick milk.

I hav worked on a pharm just long enuff tew kno that thare iz no prayers so good for poor land az manure, and no theory kan beat twelve hours each day (sundaze excepted) of honest labour applied tew the sile.

I never knu a pharm that waz worked pretty mutch by theory, but what waz for sale, or to let, in a fu years, and I never knu a pharm that waz worked by manure, and muscle, on the good old ignorant way ov our ansestors, but what waz handed down, from father to sun, and alwus noted for razing brawny armed boys, and buxom lasses, and fust rate potatoze.
—Josh Billings.

THE SECRET OF HOSPITALITY.

When a girl I visited for a week occasionally with Aunt Mary and her daughters. During one of my visits a letter came from a relative, an elderly man of some note. He was coming North for the summer, and wished to spend a few days with this niece and her family, whom he had not seen for years. I assisted in the preparations for the guest, and it seemed to me that the family was under a great strain, great attention was given to every detail and elaborate preparations made for meals. When the guest arrived, everything that could be polished had been polished, everything cleaned that could be cleaned. The house was immaculate, the meals perfect, the crystal and china sparkling. But the family seemed so worn and anxious, and it was a real relief when the strain was over.

Young as I was, the thought came to me: "Why, if mother did so much extra work for each of the many

Pioneer ROOFING

—best by every test

The Popularity of **Pioneer Roofing** is due to its **wearing** qualities. We want to go on record right here and now with the positive assertion that a "Pioneer Roof" will outlast **two** ordinary roofs. The first cost is little if any more than you would have to pay for roofing of inferior quality. And once a "Pioneer Roof" is on, there is no further cost. It requires no paint or repairs.

Pioneer Roofing is made in several weights; suitable for residences, hotels, outhouses, business blocks; anywhere that a sunproof, rainproof roof is required. Comes in handy rolls. Easy to lay. No special tools needed. Everything necessary will be found in the center of each roll, for which there is no extra charge.

Free Booklet and Samples

The mauufacturers of Pioneer Roofing have published a 32-page booklet, which is effectively illustrated. The booklet is both interesting and instructive. It tells how to lay roofing—and what weight or thickness of roofing is best suited to the various kinds of buildings. The booklet and samples of roofing will be mailed free upon request.

Pioneer Paper Co.

guests we have, we should require several servants." Then another thought followed: "Perhaps we have mother's calmness to thank for our many guests." When I returned home mother told me that Uncle Wilbur had visited her.

"Then you must be very tired, mother."

"No, child, his visit was a treat and a rest. I tried to lessen my work while he was here and thoroughly enjoyed the time. He read me the notes for his new book, and seemed so glad that I had the time to listen."

"Aunt Mary did not know that he was writing a book."

"No, the dear old soul said that he thought that Mary was not well, seemed over-burdened in some way, and he did not want to take any of her time."

Later I found that he thought my home a haven, the very spot he had longed for, in which quietly to complete his work. What had mother done? She had not altered her household routine in the least, only to leave some few things undone, that she might have more spare time. Uncle Wilbur had found a household glad to have him as a guest, had found no pretense of a different standard of living.

That is the sweetest kind of hospitality. We love our friends and long occasionally to peep in on them, and, without causing any flutter, chat and bide a while. We love them for what we know they are, not for what they have, not for what they may try to be, out of all good, but mistaken feeling. Do you know the fine feeling when you know that your coming has caused no rush nor anxiety, when simply a place is arranged for you and you live for a while with your dear ones and have a glimpse of life as they live it to carry away in your heart?—Rural New Yorker.

HOW CHILDREN SPEND THEIR MONEY.

By Miss Candis Nelson, A. M., State Normal School, North Dakota.

There are few children but what have some money to spend, sometimes they earn it for themselves, sometimes it is a gift from the parents. It is a wise thing, when at all possible, for children to have a regular allowance even though very small, and then be taught how to spend it and how to lay by some for the proverbial rainy day. Where children can earn their own spending money, ordinarily they are wiser in its use. Under our present system of allowing children to do as they please with their money, they plan to spend it mostly for candy and gum. The desire for sweets often leads them into questionable methods of saving, for example, an investigation made a few years ago in one of our western cities revealed the fact that candy and gum dealers did a better business on Monday morning than any day of the week. The supposition was that the children conceived their needs to be greater than those of the heathen and so instead of putting all their money in the collection they saved a little for Monday's purchases. Cheap shows have also, rather suddenly, become a great source of extravagance for children.

It is not a difficult thing to arouse an interest in children in putting aside for another day, money so often unnecessarily and foolishly spent. The ordinary toy bank is a good thing to encourage economy. Care must be taken that children do not develop selfish or miserly habits. Train them to recognize their responsibility to their neighbor. To set aside a certain per cent of their savings for a sunshine fund is commendable. With this they may send a postal card or a flower to the sick, they may buy a needed spoon or cooking utensil for their mother; they may put it in the church collection, or give it to some organized charity; in fact, they may spend it in many helpful ways, even though it should be only a penny or two. Saving in order to purchase an article really useful and educational, ought to be encouraged. Such articles dear to boys, are bicycles, tools, electrical toys, magic lanterns, cameras and printing presses.

Schools often undertake the work of training children to do systematic saving. The work is carried on by means of school savings banks. In Europe they have found much favor, where it is claimed, they not only train to habits of thrift and self-dependence, but reduce crime, intemperance and pauperism. They were introduced into the United States about 1885 by a French educator. In 1893 the United States had 325 school saving banks with $350,634.32 on deposit; in 1905 there were 4541 banks that had collected, since the system was introduced, $2,872,012.

The plan is to have the children bring, either daily or once a week, the amount they can save and this is turned over to some safe bank and books are returned to the children to be examined by the parents. The teacher usually keeps a book with the name of the depositor and the amount of the deposit; sometimes the child is given a card with the amount deposited punched, and sometimes he keeps account by means of stamps. In some cities, particularly in Europe, the school banks are connected with the postal saving banks. Whatever the method for handling, the principle remains the same, that is, to educate our children to be producers, contributors and thrifty citizens.

THE FOOT-PATH TO PEACE.

To be glad of life because it gives you the chance to love and to work and to play and to look up at the stars. To be satisfied with your possessions but not contented with yourself until you have made the best of them. To despise nothing in the world except falsehood and meanness, and to fear nothing except cowardice. To be governed by your admirations rather than by your disgusts. To covet nothing that is your neighbor's except his kindness of heart and gentleness of manners. To think seldom of your enemies, often of your friends, and everyday of Christ; and to spend as much time as you can, with body and with spirit in God's out-of-doors. These are little guide-posts of the foot-path of duty.—Henry van Dyke.

DUTY.

This truth comes to us more and more the longer we live that on what field or in what uniform or with what aims we do our duty matters very little; or even what our duty is, great or small, splendid or obscure. Only to find our duty certainly and somewhere, or somehow, to do it faithfully, makes us good, strong, happy and useful men, and tunes our lives into some feeble echo of the life of God. —Phillips Brooks.

THE TRACKS.

Lives of famous men remind us
We may make our lives sublime,
And, departing, leave behind us
Gasoline on sands of time.
—Harper's Bazar.

Paint Is Cheaper Than New Buildings

You know how quickly a building that never saw paint goes to rack and ruin. The boards rot around the nails, they crack and warp.

Only constant repair keeps the building standing.

An occasional coat of good paint made with

"Dutch Boy Painter"
White Lead

and real linseed oil will save your buildings and reduce repair, to say nothing of improving the looks of the place.

Decide to use "Dutch Boy Painter" White Lead this spring. It's a mighty good investment.

Write for our "Helps" No. 526 which will tell you why, how, with what and when to paint.

Scott, Magner & Miller say:

Arrivals of hay during the week ending today have amounted to 2,350 tons, which is slightly less than the amount recently received.

While we have had nice weather all week, which permitted the comfortable handling of hay from the cars and boats, yet the expected improvement in the local demand did not develop.

It is generally thought that a lower range of values will become established, and therefore no buying is being done except to fill immediate and most pressing necessities. There is a demand for lightweight fancy hay for retailing purposes. This class of hay will command exceptional attention on account of there not being much of this variety available.

The demand for export and coastwise shipments has been a little lighter this week, although there has been quite a little go forward on small-sized orders.

There is no change on alfalfa hay, and the market is ruling fairly steady on this article.

Fancy wheat	13.00@13.50

Citrus Fruit Market

LOS ANGELES, Feb. 15, 1911.

The decay which has been so serious a factor is not quite so general as for a few days, but it is still a factor with which every packing house has to deal. Every possible precaution is being taken. Many maintain that it is from the black smut which occurs in the navel end of the fruit. It is an entirely new problem, never having occurred to any such extent. The auction markets show a better range of prices, and all over the country the shortage in shipments during the long rainy spell is proving a material benefit. With the improving of the decay situation and the cleanup from this shortage, materially better prices should obtain for some time.

The lemon situation is fully as strong as it has been, and with shipments as they have been going forward, every offering is taken at a good price. Some fruit is being stored for warm weather shipment.

Shipments.

Shipments of oranges to date since November 1, 1910: 8,803 cars, lemons 1,275, total 10,078. To same date last season: oranges 5,238, lemons 1,147, total 6,385.

NEW YORK, Tuesday, Feb. 14.—Twenty seven cars navels, one navel encia and two cars lemons sold. Market higher on navels, strong on lemons. The weather is cloudy.

TO PROPERLY WASH LINOLEUM.

Linoleum-covered floors are washed with plain soap and water. Many a handsome linoleum is spoiled by the too lavish use of strong soap. The floor which has been treated to a varnish stain, and which only one rug or two will cover, is rubbed well with wax oil and then polished with a dry cloth till it looks like a sheet of burnished brass or bronze.

Wax oil is a preparation put up to order at the paint supply store. The seller knows the right proportion for each ingredient, and when he hands you the big quart bottle, which he warrants to last a good year, he demands only twenty-five or so cents in exchange.

JUST WHAT YOU NEED.

The Summer Automatic Waxed-Thread Stitching Awl will mend anything. Will repair harness, shoes, buggy tops, sew on buttons, tie comforters, sew up rents in carpets, etc. Has one large and one small point for light and heavy stitching and one curved point for patching shoes, etc. Also one wrench and one bobbin. Never before sold for less than one dollar. For the next thirty days WILL SEND YOU ONE FOR 50 CENTS postpaid. Please remit Postal or Express money order. Agents wanted. Lawton & Bushman, Dept. 6, Burlington, Wisconsin.

Influence of Lemon Stock on Quality of Oranges

There is something uncanny and mysterious in the complete change in the nature of a plant by grafting. To many the process itself is most mysterious, yet it is less so than the growth of a cutting taken from a plant and buried in the ground. The two ends of the stock or scion, whichever it may be called, as near as can be seen are identical; one end sends out roots seeking for nourishment and the other leaves and stems.

Grafting, and by grafting we also mean bud grafting, or budding as it is usually termed, is the "process and operation of inserting a part of one plant into another with intention that the part shall grow on the foster root." Grafting is one of the oldest arts of plant craft, and at one time was held as a professional class secret. Virgil writes:

"But thou shalt lend
Grafts of rude arbute unto the walnut tree,
Shalt bid the unfruitful plane sound apples bear,
Chestnuts the beach, the ash blow white with pear,
And, under the elm, the sow on acorns fare."

Some people make the process more wonderful than it really is and believe that almost any plant may be grafted upon another. The process must be undertaken, to succeed, with plants more or less closely related, though there have been cases where plants apparently very unlike have united their tissues and grown to perfection, but, as noted, plants of close botanical relationship, at least of the same genus, must be united. The pear has been known to do fairly well upon many of the thorns, even better than upon apple stock. A more homely example is in the grafting of the bean upon the chrysanthemum. As a rule, the character of the wood and fruit of the scion is identical with the parent, there being practically no apparent influence of the stock, but in the matter of thrift and size there is a well known influence which has been used to the advantage of horticulture. The dwarf pear has been produced through grafting upon quince stock, and the apple has been dwarfed by grafting upon the Paradise apple. This dwarfing has also increased the proportionate fruitfulness. The dwarfing may, and usually must, be assisted by pruning in order to accomplish best results. It has been found that a scion from a vigorous and strong growing tree, as a rule imparts some of this habit to the root stock, and sometimes, in addition, if the tree is planted below the union, roots form on the scion and give a double root system. Another instance of dwarfing is in the grafting of the cherry upon the Mahaleb cherry. Other advantages of grafting on different stocks are seen in certain plums, and where soil conditions require a root of a different nature from that of the desired tree. For this purpose the Myrobolan has been used to a great extent. Another change secured by grafting or budding to permit the growth of certain fruits under adverse climatic conditions is secured by choosing a stock which either retards or forces growth, that is, the mechanical effect of the union of stock and scion is such as to impede the passage of sap and cause the scion to mature or ripen early. Without doubt grafting does change the bearing capacity of many plants.

This discussion was suggested by a question which came to this office, as to the effect of grafting upon the flavor of fruit. The problem was raised by Nathan W. Blanchard of Santa Paula. He writes:

Nathan W. Blanchard, Santa Paula.

"I submit to you a question which is an interesting one in itself, and which I would be very glad to have light upon, namely: Will the character of oranges grown from wood produced by budding into lemon stock, which is itself a growth from budding into orange stock, be influenced by the lemon wood, say from two or three feet from the lemon stock between its own bud and the orange bud? Some years ago many lemon trees were budded over into oranges. These lemon trees were presumably grown on orange roots, so that some growers will doubtless be able to answer the above question. The early orange growers will remember that oranges grown on Chinese stock or roots were very coarse and could easily be recognized."

* * *

W. H. Bailey in "The Nursery Book" says: "Grafting may influence the flavor of fruit. There can be no question that apples often derive acidity from the stock when worked upon the wild crab or upon the Siberian crab. It is said that the Angouleme and some other pears are improved in flavor when grown upon the quince. Downing asserts that some varieties are considerably improved in flavor by working upon quince. Similar results may occur in the dwarfing of apples.

"A favorite illustration in support of the reciprocal influences of stock and scion is the fact of transfer of color or variegation by grafting. Darwin called attention to this phenomenon, and used the term 'graft-hybrid' to designate similar mongrel offspring of certain unions. But this class of phenomena seems to follow inoculation rather than grafting per se. The transferable nature of variegation is well known in certain species, but it is entirely inexplicable in the present state of our knowledge; it seems certain, however, that it does not merit attention in a discussion of grafting. So long ago as 1727 variegation was designed by Bradley a 'distemper,' which 'may be communicated to every plant of the same tribe by inoculating only a single bud.' In our own day, Morren has called it the 'contagion of variegation.'"

Now, it will be noted that Mr. Blanchard's problem, which is a common one in many parts of California, is not exactly that of the root stock. His stock to start with was presumably sweet orange root. On this was grafted, or budded as we express it, a lemon. This lemon was in turn budded after reaching maturity to the Navel orange. What is the influence of this intervening lemon wood? It is an interesting problem because there are hundreds, in fact, thousands of acres in California which are subject to this influence. It is well known that on Navel trees there is almost every imaginable form and quality of fruit from the typical luscious, perfect orange to the rough oversized prickly no-good product. Is this because of root stock influence or bud variation? It is believed and doubtless correctly, that it is bud variation. But is that always and the only cause? It is an interesting question, therefore, on receipt of Mr. Blanchard's letter, we submitted his question to a number of growers in California. All have not answered; many have replied that they had no knowledge of any influence; others whose answers possess great interest we give below:

J. Eliot Coit, Pathological Laboratory

I will simply say that as far as my experience goes I know of no concrete cases where such a procedure has turned out to the grower's disadvantage. This, of course, is not saying that oranges are never influenced by lemon wood. In my own orchard, however, I would have no hesitancy in budding them over.

Chas. H. Rodgers, Watsonville.

Will say that I have had no experience with citrus trees. However, from my observation and experience with deciduous trees, I believe that the stock does not exert any influence on the character of the fruit of the ingrafted scion. If this be true of the deciduous tree I see no reason why the rule should not hold good in case of citrus trees.

J. H. Norton, Citrus Ex. Sta., Riverside.

As to Mr. Blanchard's query I know of nothing to say on the question that could be relied upon. I will be able as soon as the Valencias are picked to give you an article on the influence of the root on the fruit, for we have the Navel, Valencia and the Eureka lemon on each of the following stocks, sour, sweet, pomelo and trifoliate.

Chas. A. Chambers, Fresno, Nursery.

Referring to your inquiry under date of the 10th inst., relative to budding citrus stock and its effect on different roots, beg to say from my experience in grafting old trees over, both oranges into lemons and lemons into oranges, I am of the opinion that the bud inserted will reproduce the parent of the bud, regardless of the root on which the bud is worked. This is true of the pear, nectarine, apricot, peach and other deciduous stock. It is also true of grape vines. We have grafted over Zinfandel grapes to Malaga and Thompson Seedless and no taint of the Zinfandel exists. Our experience with citrus trees has been the same whether a bud is inserted into pomelo, lemon, sour or sweet orange stock, the bud always represented the parent tree from which the bud was taken. A tree no matter how many times it is budded, in our opinion will not vary. We are, however, of the opinion that pollination is the cause of variance in fruit. We think that orange blossoms are fertilized with pollen from lemon trees in many instances affecting the flavor of the fruit. The natural texture is not affected. We have seen peach orchards where the blossoms were fertilized by bees or other insects with pollen from nectarine trees which were growing in the same orchard and the peach trees bore distinct nectarines scattered among the peach tree branches. Last year I sent Prof. Wickson a limb from a Muir peach tree which bore both nectarines and peaches on the same limb. Two nectarines were at the top of the limb and two at the bottom, with Muir peaches between on the same limb, not laterals.

Leonard Coates, Morgan Hill.

I would say that I do not think there would be any appreciable difference in oranges budded as suggested by your correspondent. The only influence which stock has on scion, so far as I have observed, is to either accelerate or retard the ripening, or budding out in the spring. I do not think the quality of the fruit is changed, and where this may be thought to be so, it is probably due to some other cause such as soil properties, which may be the outcome of some particular fertilizer which is used.

W. H. Schureman, Indian Hill Citrus Association, North Pomona.

As to "the character of oranges grown from wood produced by budding into lemon stock, which is itself a growth from budding into orange stock." The writer does not believe for a moment that such lemon wood has any influence one way or the other. We have a great many hundred (I might say thousands) of orange trees so grown; and we can not detect any difference now, or when

(Continued on Page 228.)

We regret that the pressure of advertising has crowded out much of the citrus material intended for this issue. A magnificent large half-tone engraving of Butte County orchards, made especially for this number, is held over for a future issue. With it, a description of the growing of citrus nursery stock and other items and illustrations will make later Cultivators of value to citrus people.

Speaking of the advertiser, by the way, the advertising department is much gratified with the increasing popularity of the Cultivator. Over eighty columns of ads makes this the banner issue. Even as it is several columns of ads are left over.

Systematic Orange Pruning Profitable to Fruit Growers

Prof. Charles R. Paine of Redlands Tells How "All Green Inside Means Money to Me." Investigations and Experiments are Leading to Better Information Regarding Orange Tree Pruning. Longer Life Secured by Systematic Pruning.

In answer to your inquiries concerning the pruning methods I am advocating to make decadent and old orange trees renew their youth, and to delay younger ones on their way to old age, I reply that interest is manifested, on the part of some, by intention to visit the groves where the work has been done; oftener, by visits of many growers, even from long distances, some of whom are frank to admit, after inspection, that they expected to see destructive work in the top opening, and the exploitation of a hobby.

When entering the place from the south, the view of one small grove in sorry plight, resulting from a loss of six inches of surface soil from a sudden August downpour, several years ago, is disappointing indeed to one looking for something good. That, too, is recovering from its desperate condition, for the thinness of the outer branchlets gives opportunity for light energy to stimulate the larger parts of the branches to yield up their store of food to make green leaves again.

On coming to the groves where the saw and shears have opened the grave of the dead interior of the trees, all visitors, without exception, whatever their previous notion, express appreciation of the results obtained, seeing plainly that, by this pruning method, normal laws of growth are given opportunity to operate. When they stand among trees planted twenty-eight years ago, some of which have a forlorn look outwardly, and see within a renewal of vigor, they realize that, as long as the soil can be made to yield suitable nourishment the old tree can be made fit to transmute it into fresh foliage and fruit of pristine quality.

Expressions such as these were common: "All green inside;" "this means money to me;" "I have been eighteen years in the orange-growing business and never thought of anything like this." The last utterance was from the superintendent of a two hundred acre orchard and he has already applied the method to groves under his charge. Others are planning to do so when the crop is off.

The economy of the labor of pruning has been especially remarked upon, for it is the work of little time to remove the obstructing branches in the top.

Dean Wickson of our State University, from a knowledge of the laws of plant growth derived from his chosen life-work, remarks with striking appreciation of the process, with which he has acquaintance by description only: "It is particularly true in principle, and if intelligently introduced into practice, would bring all our old trees into a condition of superior thrift, and promote the production of better fruit. The idea of allowing these old trees to become dark and unproductive in the center is irrational and reflects no credit on our pomological energy and intelligence."

I note, too, that our present State Commissioner of Horticulture, Mr. Jeffrey, a man of keen observation and strong common sense, advocates in his department of "Farming in California" in the Los Angeles Sunday Times of February 5 the growing of oranges only on the regularly developed typical fruiting branches, and not on water sprouts, which at first are attached merely to the surface, for "these monopolize the growing life of the tree at the expense of its natural inclination to fruitage of an even type and regular quality." Mr. Jeffrey observes also that "orange splitting is seldom severe in what we recognize as typical fruit," making the exception that "the phenomenon appears in the weakest portion of the tree—the part of the plant always the first to fail in case of irregularities of growth;" and that there exists a "necessity for proper pruning, and that all ideas upon pruning the orange are now under revision."

We all know, however, that good results have been obtained both in tree and fruit without pruning at all; this can be only in such cases as when new growth at terminals is abundant and active in successive seasons; even then, death, instead of what might be active life, prevails, save where there is outward exposure, and the ultimate stage of the tree is sooner reached.

It is unfortunate that the industry must suffer with the grower, for with a dying interior and terminals carrying small and yellowed leaves, the fruit both in quantity and especially in quality, shares in the poverty of its situation.

It is plain, then, that in pruning, the older growth which has served its best use, must be taken away, because while remaining it becomes a hindrance; and that the aim should be to develop in its stead, throughout the tree, only the well-known typical fruiting wood, the kind with broad leaves of a healthy green, which kind alone can manufacture the food containing all the elements that are combined in the best orange. It is not desirable to foster the long, rank growth, for it shades and impoverishes the limb it grows from, and its product is coarse, like that of the young tree, nor is it worth while to retain the end growths of trees poor from any cause, whether from crowded branches, from age, from washed or infertile or poorly tended soils, or from conditions irregularly moist and dry; these must give way to their betters, growing behind them.

There must be not only years of research and scientific experimentation, but never-ending efforts in these directions, to satisfy the minds of enterprising growers, and the demands of critical buyers.

While I would be classed with these seekers after the true, in our business of orange culture, I feel assured that already it is an advance along this line to have effected a method of producing, according to natural law, on the limbs of the old tree, from its still sturdy trunk to its exhausted terminals, and in the interior of younger trees, new and abundant shoots of the best type for fruiting.

It is also true that these new leaves and fruit are using for support idle food supplies, hitherto not a factor in the life activities of the tree.

Observations of the Year's Work in the Citrus Orchards

Love For the Most Attractive Fruit of Horticultural Industry is Expressed by J. H. Reed. Some Events of the Year are Powell's Coming, Advancement in Frost Protection, Mr. Shammel's Work and Efforts Toward Soil Investigations.

An article is asked for the citrus issue of The Cultivator. I find myself inclined to respond because of the love for what, to my mind is, all things considered, the most attractive industry that has to do with production from the soil. I think we should get much more out of our orange groves than the dollars they return. Allow me a brief reminiscence. Years ago I reached Milan, Italy, by way of the Simplon Pass, after dark. In the morning I found my windows opened onto a garden of orange trees. I thought the shapely trees with the yellow fruit snuggled in the green foliage the most beautiful sight I had ever seen of plant life, and the picture has remained vividly in my mind from that morning. And to this day I do not pass our orchards, especially at the present stage of fruitage, without a feeling of great delight.

When I came to California the orange orchards captured me at once, and for more than a score of years have claimed my best thought and effort. Hence every endeavor to advance the interests of the industry appeals to me.

Ours is a progressive industry. Much has been done towards its best development, but it awaits further intelligent, persistent investigation and experiment.

Most Important.

Of the incidents affecting the industry during the past year I think the coming of Mr. Powell to take the management of the Citrus Protective League, which the most of us are identified with, is quite the most important. His familiarity with the needs of the industry from the propagation of trees to the marketing of the fruit: his long and intimate relations with the federal department of agriculture, to which we must sometimes appeal for help to solve our most difficult problems; his wide acquaintance with leading men connected with transportation, as well as with the most prominent managers in the great fruit distributing centers; his study of the citrus industry on the ground, in the Mediterranean countries, with which we must compete; his proven high executive ability and pleasing personality, all render him peculiarly fitted for the great task assigned him, and should command for him the hearty support of growers and handlers, individually and combined.

Frost Prevention.

The prevention of damage by frost to fruit and tree which cost us so many millions, is no longer a question of practicability. The problem is definitely reduced to finding the most efficient and economical means. Much has been done in this direction, more than is appreciated by those who have not in mind the beginning of the investigations. It's but a few years since the Riverside Horticultural Club, so far as I know the first to go beyond discussing the matter, commenced its practical experiments. Some cold nights we had a half dozen or more different experiments in operation at the same time, including coal in wire baskets, oil in pots, smudging fires, vapor from water heated in wide, shallow pans, running water, heated water run in furrows. Some of these were elaborate and expensive experiments. In one instance the experiment of covering an area of several acres of trees with a lattice of lath was tried. But at that time few growers or any others for that matter, had any confidence in the effort to raise orchard temperatures sufficiently to prevent damage, and we were much ridiculed. "The idea of warming up all outdoors; it is simply ludicrous."

To our "hind sight" many of these devices seem crude and foolish, but they led the way to something practicable. The coal in wire baskets proved most efficient and was extensively used for a time. Later combined dry heat with smudge from special fuel in special receptacles has largely taken the place of other devices.

While we have escaped damaging low temperatures thus far this season, had they come they would have found a much more general preparation for protection than ever before, and I confidently expect it will be but a short time before the citrus industry in exposed districts, through perfected devices and co-operation, will be as fully and regularly prepared to save its fruit and trees from frost damage as are the apple orchardists of Colorado or the vineyardists of France and Spain to save their products from like harm.

Improved Strains.

Among the important incidents of the year are the encouraging results in the work of establishing fixed strains of the best oranges and lemons, being carried on so efficiently and enthusiastically by Mr. Shammel under the auspices of the Washington department of agriculture. That the object sought will be secured is being demonstrated beyond a doubt. When the planting and expensive care of citrus orchards can be carried on with the assurance of securing a uniform product of high-grade in place of the present large proportion of low grade and cull fruits, in my opinion the most important problem of the industry will be solved.

Standardizing our oranges is good, but it is quite more desirable that we secure a larger proportion of fruit that will grade high when the standards are fixed.

Soil Fertility Investigations.

There is one matter, one of the most important matters connected with our industry, as to which we cannot report much real progress—the efficient, economical fertilization of our orchards. Did results correspond with discussions, lectures and the voluminous publications on the subject, they would be great.

That much valuable information has been secured by scientific investigations of the state department and individuals, and by further discussions of the subject by recognized authorities, no one questions. But that the majority of us are yet guessing when we come to practice, I think there is as little question.

We had with us last summer perhaps two of the best soil specialists in a general way, the country affords. Since the conventions at Pomona and later at Los Angeles, at which these high authorities lectured, and where the subject was discussed at length by some of our most successful growers, I have made some effort to find orchardists who have materially changed their practice in fertilizing because of these discussions or the vast amount of published advice, but without success.

I am more fully convinced than ever that this most important problem will not be solved, permanently or satisfactorily, till the state department or the federal department, or both jointly,

(Continued on Page 255.)

LARGEST CITRUS NURSERIES IN THE WORLD

Parties contemplating the planting of citrus groves this coming spring will do well to send for our prices soon, as there will evidently be a shortage of strictly first class stock. Write today for particulars, or, better still, pay us a visit so that we may be able to show you just what we have.

Our finely illustrated booklet, "Citrus Fruits," covering the industry from the seed to the market, mailed to any address on receipt of 25c in stamps.

FLORIDA SOUR ORANGE SEED.
and Sweet Seedlings For Sale
OTIS E. HYDE, 1314 W. 51st St., LOS ANGELES, CAL

(Continued from Cover Page.)

the buds first commenced to bear; and some of these buds have now been bearing six to eight years.

O. T. Bryant, Fillmore.

The question you ask has interested me a long time, and I am glad you are investigating. I may say we have over 100 oranges (Navel) here which were originally lemons. I cannot myself see the slightest difference in their product from that of any neighboring orchard.

Frank L. Palmer, The Seth Richards Orange Grove, North Pomona.

I understand Mr. Blanchard's question to be whether the character of oranges grown upon wood produced by budding over bearing lemon trees will be influenced by the lemon wood, the root being orange root. I have 146 trees of that character; the root being orange, the body of the tree lemon, and the new top orange. These trees were planted as lemon trees in 1891; and, after producing lemons for several years, were budded over to Navels in March, 1900, and have now been producing Navel oranges for nine years. The quality of the oranges is excellent and very abundant in quantity. I cannot see that the fruit has been influenced in character by the fact that the sap runs through a lemon body.

C. C. Teague, Limoneira Company, Santa Paula.

Will say that the matters which you ask about are matters that I have no experience with whatever. The only experience I have had is budding orange stock to lemons, which has been very successfully done, even though the stock was old.

Prof. Ralph E. Smith, Pathological Laboratory, Whittier.

Regarding the character of oranges grown upon branches budded into lemon trees, I would say that such groves are particularly abundant in the vicinity of Whittier. These are upon orange root. Various opinions have been advanced as to the eeffct of such a combination, but in actual experience there is so far as I know no appreciable difference between oranges produced in this way and those grown directly upon the orange root. Certainly the difference, if any, is very slight.

C. D. Hubbard, San Fernando.

I budded over ten acres lemons for party to Valencias and fancy Tangerines. They made fine tops and bore good, smooth, fine flavored fruit. The roots were seedling oranges, and from the ground up two to three feet lemon wood. Lemon wood was ten years old at time of budding over to orange.

Citrus Culture In Northern California

N. B. CRANE, OROVILLE.

With the coming of the early miners in 1851, oranges were brought from Acapulco, Mexico, the seeds of which were planted, and from them two orange trees were produced, one of which still remains where first planted, at the south end of the suspension bridge at Bidwell's Bar, on the middle fork of the Feather river, eight miles above Oroville. The other tree proved to be of the "kid glove" family, and being at that time of no commercial value, through neglect soon died, leaving the one tree at Bidwell's Bar—the survival of the fittest. And from the time it first came into bearing, up to the present moment, it has never missed a crop. Growing as it does upon a rocky bluff overlooking the Feather river, without any particular care, it has reached a height of forty feet and is thirty feet in diameter, and produces oranges by the thousands. From this tree the foundation was laid for the successful planting of many of the first groves in this locality. Seeds were sold at $1 an ounce. The quality of the fruit was of the choicest. Crops have been known to sell upon the trees at $1,250 per acre. This variety of oranges is now known as the "Gold of Ophir." With the introduction of the navel orange, it having proved to be the superior fruit from a commercial standpoint and that which the general market required, it is being superseded.

Our groves are now nearly all worked over into navels, for we find that they pay more per acre than any of the other varieties. Coming on to the market the last of October, we have the advantage of an almost bare market, and as a result receive top prices. The bulk of the crop is on the market for the holiday trade.

Very few Valencias are raised, as the navel proves to be the best paying crop. Our oranges are shipped all over the world, to the Orient, and Australia, to England and the Continent, but the most of the crop is consumed in the United States. This year our crop was upward of 1,000 cars.

At the Midwinter Fair held in San Francisco in the year 1894, the committee selected to award the prizes on citrus fruits consisted of seven men, five of whom were from Southern California, one from Placer county, and one from Butte county. This committee passed upon the different citrus exhibits, not knowing from what locality the fruit came, and awarded sixty-five per cent to Butte county.

Lemons, wherever planted, have produced wonderfully, but with us they are more of a seasonal than an annual crop, coming on to the market for the holiday trade, and continuing to the following July. During the balance of the year they bear but sparsely. The pomelo, or "grape fruit," produces wonderful crops here, and of the choicest varieties, and is very remunerative.

I presume many of the readers of your valuable paper in the "Southland" will read this with many grains of allowance, when I tell them that here we seldom have frost that kills the tenderest vines, that a "fire pot" has never been seen, that we have no pests to combat, which not only sap the vitality of the tree, but very materially lessen the net results of the producer, that here, from the time the fruit sets until it matures, it never chills, which hastens the ripening and gives us an early market.

In conclusion, allow me to say that we do not confine our efforts to citrus culture alone, for here the olive is raised in great quantities and of the best quality. Figs are produced in abundance and of the choicest varieties.

I am an old Riversider, and know whereof I speak. The praises of this locality can be sung continuously, and then one-half will not be told.

Are Your PROFITS DRYING UP?
FOR THE "LAND'S SAKE" Why Don't You Irrigate That Farm of Yours?
You don't need a Surveyor. Get a Bostrom Improved Farm Level and do the work yourself.
THIS LEVEL IS NO MAKESHIFT. The outfit includes Level, Telescope with magnifying glasses enabling you to read the target a quarter of a mile away; Tripod, Graduated Rod, Target, and Bostrom's 70 page book—"Soil Salvation"—giving the cream of 25 years practical experience in Irrigating, Draining and Terracing, with full instructions how to use the Level. Simplicity, Accuracy, Durability Guaranteed. Used and endorsed in every State in the Union, also Canada and Mexico. Price $15.00.
If not on sale by your local merchant, he will order for you; or you can write either of the following jobbers direct, who will see that you are supplied. Pacific Hardware & Steel Co., San Francisco or Los Angeles; The Thomsen-Digge Co., Sacramento; Hazard, Gould & Co., San Diego.

CALIFORNIA FRUIT GROWERS EXCHANGE

Seventh Floor Consolidated Realty Building

LOS ANGELES, CALIFORNIA

The Growers Marketing Organization.

The business conducted at actual cost.

No profits except to the growers themselves.

Branch offices in all markets.

Able and experienced salaried salesmen in charge.

Selling California citrus fruits exclusively.

Our Fruit Growers Supply Company

Has effected great saving in cost of all packing supplies.

It is now buying fertilizers for our growers where requested.

The result is a general reduction in all fertilizer prices.

We welcome visits from the growers and the trade at all times.

Have You Written For Your "NATIONAL" Style Book

Are you waiting? Have you postponed writing? Are you likely to forget—that we have one "NATIONAL" Spring Style Book put away for you?

Then let us repeat that one "NATIONAL" Spring Style Book is Your **very own,** because we have reserved books for every reader of this publication. And we have taken this page in your magazine simply to tell you about this very wonderful new Style Book.

Every page of this 224-page book will prove to be a page of interest, and of beauty, of style instruction, of fashion opportunity, and of money saving. It shows you all the new styles in all kinds of apparel for Women, Misses and Children—and all at *money-saving prices.*

It shows you

Lingerie Dresses	$3.98 to $19.98
Silk Dresses	$11.98 to $22.50
Waists	98 cents to $8.98
Skirts	$3.98 to $14.98
Hats	$1.98 to $14.98

And **"NATIONAL" Tailored Suits Made-to-Measure from $15 to $40**

It is the most interesting Style Book ever published.

Pure Linen Hand-Embroidered Waist

Regular Price, $1.75

Price, $1.00

Postage Prepaid By Us.

No 21A11 There are seven notable points about this beautiful waist.

First it is *pure linen.* Yes, Madam, we mean Pure Imported Irish Linen. It is **Hand-embroidered**—guaranteed—and prettily and neatly done. It is lace-trimmed as pictured, and it is one of the very newest and most delightful styles.

It is a regular $1.75 waist, now offered at a friend-making price of $1.00. And we pay the postage.

Fact No. 8 is, that if you are not delighted with this waist—if you don't think it actually cheap at $1.75, send it back at our expense, and we will refund your money. The charming style feature of this model is the simulated front closing in effective point design, trimmed with lace insertion and a ruffle of edging, further enriched with Irish crochet buttons and hand embroidery. A yoke effect is formed of pin-tucks and wide tucks on the shoulders. The back, which closes invisibly, has clusters of pin-tucks, and the fashionable sleeves are tucked and lace-trimmed to form deep cuffs. A lace-trimmed high collar completes this very becoming waist. **SIZES:** 32 to 44 bust. **White only.**

Worth anywhere $1.75.

Special Price, $1.00

Be Sure to State Size Desired.

Citrus Trees Exclusively.

Tulare County Citrus Conditions

W. E. SPROTT, Porterville.

The season that has just closed in Tulare county has in many respects been a remarkable one. It has been remarkable for the fine quality of the fruit both in eating qualities and in looks and the satisfaction that it has given the eastern trade. The only difficulties that the growers had to contend with in marketing the crop were the large sizes. However, as the consumers managed to dispose of nearly double the number of carloads that we have ever sold before in the months of November and December it is evident that the fruit was satisfactory to them.

The growth of the citrus fruit interests in Tulare county is enormous and while our tonnage has not increased very much at present this is owing to the fact that the large plantings of the last few years are only just commencing to bear. The time will shortly be here when there will be largely increased shipments from this county. The orchards of Tulare county are in splendid shape and the future of the industry looks very promising. Conditions of soil, water and climate vary somewhat from the conditions in other parts of the state and there is no doubt that the growers will have problems to solve, as their orchards grow older, in maintaining the fruitfulness of their trees, some of which problems the older districts have already experienced.

We have a most efficient horticultural commissioner whose duties, however, lie chiefly, not in eradicating pests that exist but in keeping out pests from infested districts, it being generally acknowledged and certified to by the state horticultural commissioner that the orchards of Tulare county are entirely free from scale.

A Good Orange Outlook for Arizona

BURLE J. JONES, Phoenix.

Though given in the government reports as normal, the Arizona crop of Navels was not up to the standard in quantity or quality, and by quality I mean in size, for they averaged larger than usual. This appeared to be due to the fact that the crop was light and that this caused the fruits to attain unusual size. This was, of course, a factor that had to be reckoned with in shipping into markets that were calling for the smaller sizes and was the predominating factor that brought the returns below what they have been in the past. In spite of all of these things, and the added fact that the California navels ripened earlier than usual and thus gave unusual competition, the prices received for the forty-five or fifty cars shipped from the Salt River Valley were very gratifying to the growers.

Perhaps the greatest difficulty that presents itself to the orange growers of this community lies in the fact that the output is too small at present to be handled in the most economical manner or to attract the proper attention in the markets to which it is shipped. Experienced help for the packing cannot be secured economically and the management is not always able to keep in touch with the markets that will be most receptive at the time that the fruit arrives. Plantings of orange trees have not gone forward every year since the pioneer groves were put out because the water supply was entirely too uncertain to warrant putting so valuable and expensive a crop at stake. The result is that the production has not been increasing materially and there has been no way to remedy the difficulties mentioned above.

With the completion of the Roosevelt Dam and in fact during the past three years, many young groves have been set. Last year there were about 30,000 trees planted in the valley and this year's planting will probably amount to 15,000. The decrease this year over last is due to the fact that the horticultural commission has wisely decided against the importation of any citrus stuff from Florida, which has in the past been the chief source of supply. The fact that even 15,000 will be planted, practically all bought in California at a cost generally exceeding a dollar a tree indicates that the community is eager to go forward with the planting of this sort of trees. There are a number of local nurseries that have passed through the pioneering stages and are now in a position to begin to supply local needs. It has been estimated that there will be between 150,000 and 200,000 trees from them that will be ready for orchard planting in the spring of 1912. This will go far toward eliminating any possibility of the introduction of insect pests and diseases, a thing which the country has been constantly liable to in procuring stock from outside sources. It will also add great impetus to the planting of orchards, since it will convince newcomers that the trees are at home in this climate and that they can be grown in all stages without material difficulty or loss.

The present enviable position of this country as a producer of citrus fruits rests largely upon the excellence and early ripening of the Washington Navel. The fact that this fruit can be put into the Christmas markets in prime condition is one of great importance to the community, a fact that has been discussed in almost every citrus article covering this region.

The Navel seems to be particularly adapted to this region. It thrives in arid situations, when given sufficient water, and matures a fruit which for general size, texture, color and flavor cannot be excelled. These things being true, it is not to be wondered at that it is in most demand by those who are planting trees here for profit. Yet it is by no means the only one to be called for. Some of the finest groves in the territory are Valencias. Largely because of cultural methods in the past and water conditions the seedling varieties have attained the greatest size and are by far the most productive. It is not uncommon to see huge Valencia trees literally loaded down with fruit. The fruit, like the Navel, matures to a very uniform size, and excellent smoothness, is thin of rind and of excellent quality. It can be left on the trees for several months without deterioration. The normal picking season for this variety is March, but I have taken Valencias from the trees in June that were full of juice and very deep in color, a thing which is not true in many regions where this fruit has a tendency to turn green when left too long on the trees. There is a grove of pomelos at Yuma and another at Phoenix that are always winners of blue ribbons in every competition. One of these took the medal at the St. Louis fair and its fruit is in great demand wherever it has been introduced. Its owner reports that his fruits net always $5.00 a box and often more. The grove at Yuma is equally noted and generally sells its fruit in Los Angeles for local consumption. There are several varieties that ripen here in November, and some may even be gathered in October. It is unusual that a fruit which has in the past reached its greatest perfection in a region so humid as Florida should be equally perfect in this section, yet such is the case with all varieties that have so far been introduced here. This fact has led to a considerable demand for pomelo trees and many planters who are putting out twenty and forty acre tracts are putting them half to pomelos.

I do not feel capable of giving you any definite information as to the

CITRUS Trees

BUY CITRUS STOCK FROM THE LARGEST, BEST EQUIPPED NURSERIES ON THE COAST

In our nurseries at Exeter, Tulare County, and Whittier, Los Angeles County, we have a magnificent stock of all the best varieties n Oranges, Lemons, Pomelos, etc. The growing of first-class trees cannot be accomplished unless suitable soil and climatic conditions are provided. The heavy black loam soil in which our trees are grown, is ideal for the development of sturdy, strong, well matured trees with excellent roots. The climatic conditions under which Roeding & Wood stock is grown cannot be excelled.

EVERY TREE TRUE TO NAME

Our many years of experience in the growing of citrus stock in this state, with our knowledge of conditions, enables us to grow the most desirable varieties suitable for planting, and to guarantee that every tree sold by us is true to name. You may be certain your order will be satisfactorily filled with perfect trees, strong and thrifty, with well developed roots and true to name.

We are prepared to fill orders for almost any quantity of all the standard varieties, and will be glad to furnish quotations for carload lots or less.

ORANGES:
Washington Navel,
Thomson's Improved,
Valencia Late, Etc.

LEMONS:
Eureka,
Lisbon,
Villa Franca, Etc.

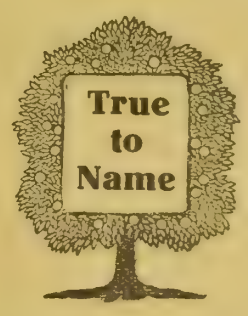
LIMES **POMELOS** **CITRON**

We invite correspondence on any subject pertaining to our business, and will gladly furnish advice without charge.

We promise best personal attention to all orders, will make prompt shipment and insure trees reaching our patrons in first-class condition.

PLACE CITRUS ORDERS NOW.

Citrus trees should be planted in March, April or May, but more planting is done in April than in any other month. Orders should be placed at once to insure getting the best stock.



If you have never planted Citrus Trees, we will gladly consult with you as to the best methods to pursue to obtain maximum results. With suitable soil and climatic conditions, there is no crop that will, year after year, yield you better returns than a well developed citrus orchard.

acreage here that seems really adapted in soil and climatic conditions to the culture of these fruits. The past two winters have given a much more definite trend to this matter than has hitherto been possible. A series of unusually warm winters had encouraged planters to experiment with these trees in all parts of the Salt River valley, and the repeated dangerous or damaging weather of the winter of 1909 went far to convince these adventurous souls that they were running too big a risk. The temperature between the protected section along the hills and the flat land bordering the river often showed a difference of six to eight degrees. It is expected that as the intervening slopes are planted and natural or artificial protection results it will become more tolerant at low levels that are now considered too much of a risk. Eastern people as well as many with years of experience in California are coming here and investing in various parts of the valley, though generally in regions now recognized as being in the "orange belt." It is said on good authority that a number of men from California are now negotiating for a tract of land in the hills above the canal. They maintain that they can pump water to supply their needs as is the current method in California. This is doubtless true, and if the plan is undertaken it will open still greater possibilities here and will doubtless eventually make available to orange culture many of these coves in the hills above the irrigation system that are peculiarly suited by climatic and soil conditions to the culture of these fruits. Appropriations have been made for the establishment of power plants along the so-called crosscut canal and this will furnish ample electric power for this sort of irrigation. With all of these factors operating it is impossible to make any sort of an estimate of the citrus possibilities of this country, but it is likely to reach many thousand acres.

In the older groves cultural methods are constantly improving. Concrete ditches are being made to supplant the old natural ditches and a great saving of water is thus accomplished as well as a better distribution. Fertilizer experiments are also being conducted in several localities to determine what elements of plant food are necessary to increase the yield and general average of the fruit and it appears that this business of orange growing is soon to become one of the largest and most profitable of the country with certain water supply, better transportation facilities, and increased production with a consequent improvement in picking, packing and shipping methods.

ORANGE FREEZING POINT.

I notice an article in the Times-Union of January 21, with the following headlines: Citrus Fruit Freezing Point is Determined by a Series of Experiments Made Recently at Rollins College by Dr. O. W. Sadler.

It appears from this article that Dr. Sadler has determined by scientific investigation that the juice of the common orange will stand a temperature of 21.79 degrees. It may be possible that the juice of the orange, on account of the acids and sugar it contains will stand this degree of temperature, but every orange grower who has had experience with cold weather effects on the orange knows that the pulp of the fruit will not stand a temperature of 25 for any great length of time and, if the writer is not mistaken there was a very interesting experiment published in the Times-Union either last winter or two years ago showing by a very ingenious experiment that the common Florida orange would freeze at a temperature of 26, if the thermometer remained there for a period of four or five hours.

It is of no practical benefit for the orange growers to know when the juice of the orange will congeal, but if Dr. Sadler will, by any scientific investigation lower the record already established of the point at which the pulp of the orange will freeze and rupture the cells of the fruit he will confer a great favor upon the orange growers of Florida and can present his claim to them for a valuable gold medal with absolute success.—Times-Union, Jacksonville, Fla.

W. A. T. STRATTON, Petaluma, Cal.

Orange and Lemon Industry in Arizona

A. W. MORRILL, ENTOMOLOGIST, PHOENIX

The past year has been in several respects an eventful one for citrus culture in Arizona.

Probably the most important advancement has been in the demonstration that citrus nursery stock can be successfully grown here. The spring of 1910, by reason of its excessive heat, was one of unusual severity for nursery stock newly transplanted from the seed bed. While it is true in some nurseries the losses due to the unusual condition referred to were as high as twenty-five per cent, the experience gained under these most trying conditions may be confidently considered to place the growth of citrus nursery stock in Arizona on a stable basis. It is estimated that there will be in the neighborhood of 200,000 home-grown trees available for planting in the spring of 1912. These trees will be as thrifty as any nursery stock grown elsewhere; they will be entirely free from scale insect pests and fungous diseases; and will not be subjected to the deterioration which, in the past, has resulted from the importation of trees from long distances.

The bountiful rains which have fallen during the past two months have resulted in a stored water supply for the Salt River valley which removes all fear of future shortages in the citrus belt. Furthermore, recent arrangements made by the reclamation service will make available for future plantings a large tract of land on the south side of the Salt river, which heretofore has had no adequate water supply. The unusually low temperature of the winter of 1909-10, when similar conditions were prevailing in Florida and California, were successfully met by one nurseryman who was prepared for orchard heating; and the study of weather records of past years indicates that with proper preparation low winter temperatures need not be feared by Arizona nurserymen.

The quarantine which has been established by the horticultural commission, prohibiting the importation of nursery stock from the Gulf coast citrus growing states, owing to the danger of importing the citrus whitefly even under the strict regulations enforced the previous season, has given an impetus to the local nursery industry. The future tendency will probably be to extend the quarantining of citrus nursery stock to include all points known to be infested with dangerous citrus pests. This will insure for years to come a strong local demand for the clean healthy nursery stock which will be produced in Arizona, and will eliminate competition with nursery trees of a questionable character as regards insect infestation.

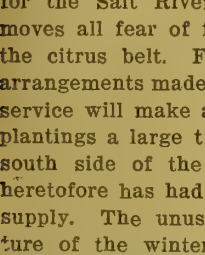
Aside from the indirect benefits resulting from the horticultural law, as discussed above, the first year's operation of this law has resulted in a better understanding on the part of citrus growers of the importance of strict protective measures against the introduction of pests. Their attention has been called to the insecurity in placing reliance upon climatic conditions for protection, and the sentiment against unnecessarily risking the future of the industry is rapidly becoming stronger. The present condition of assurance that the horticultural law now in force will be supported in the future and strengthened in the weak or defective features means much to intelligent investors in citrus lands. This condition at a time when none of the many citrus pests of Florida and California have obtained a foothold constitutes one of the most important assets of Arizona's citrus industry.

In common with all citrus producing regions the citrus industry of Arizona is confronted with problems for solution. These problems we believe are such that satisfactory solutions will not be difficult to attain. The Arizona agricultural experiment station made a careful survey of the citrus industry in 1908, the results being published in bulletin form (No. 58) by Dr. J. E. Coit, now of the Whittier laboratory, but at that time horticulturist of the Arizona station. The experience of citrus growers in the last two years has resulted in better defining certain important problems in connection with cultural methods and irrigation. It is more and more evident that these problems require local experimentation and that the best results cannot be secured by adopting without modification the time tried practice of other climates.

One important advance which has been made during the past year has largely resulted from discussions brought out at citrus institutes held under the joint auspices of the experiment station and horticultural commission. This consists in the awakening of citrus growers to the desirability of a closer study of local conditions and of testing somewhat radical ideas concerning cultural methods. Other problems relating to increasing the productiveness of citrus groves in Arizona are the subject of experimental work planned by the experiment station. Probably the first appearance of a spraying outfit in an Arizona citrus grove will soon be made in connection with the experimental work to determine whether or not the withertip disease or the citrus thrips are of sufficient importance to justify expenditures for control measures.

The proved citrus belt of the Salt River valley comprises about 100,000 acres. There are approximately 800 acres in bearing orchards and about 500 acres of non-bearing. The experience at the experiment station farm near Phoenix indicates that the Satsuma orange on trifoliate stock can be successfully grown even under the most unfavorable conditions met with in the Salt River valley. This is of interest principally to residents who desire to grow oranges in yards and gardens for home use, although an effort is being made in Texas and Louisiana to build up a demand for the Satsuma in eastern markets. The present bearing acreage of citrus fruits consists of nearly three-fourths Navels and the remainder Valencias, Sweet Seedlings, Jaffas, lemons and grapefruit. The tendency of Arizona citrus fruit to ripen early is well known. Navel oranges are usually sweet in September, but naturally are not sufficiently juicy to pick at that time. At Yuma ripe oranges have been picked and shipped as early as October 8th. As a rule Navel oranges are in prime condition for picking by December 1st and the bulk of the crop is shipped for the Christmas trade.

It has long been considered that grapefruit were not suited to western climates and the superiority of the Florida product has been generally admitted. For some reason which it would be difficult to explain, however, Arizona citrus growers both in the Salt River valley and near Yuma produce grapefruit which compares favorably with the best. That this is a profitable and successful crop in Arizona has been abundantly proven. One of the most significant records of the past two years was recently brought to the writer's attention. On the south side of the Salt river near the new citrus tract previously mentioned, nine grapefruit trees produced fruit in 1909-10 which sold for $200 and in 1910-11 for $264, averaging nearly $26 per tree for the two seasons. One grower in the older citrus belt of the north side cleared $700 from 100 trees.



White Leghorns

A Standard Strain of Great Layers and Great Winners. None superior. Prices reasonable. Descriptive booklet of our stock and farm and recipe for mixing best and cheapest egg-producing mash, sent free for stamp. Eggs, stock and baby chicks for sale. Also a grand lot of cockerels.

On a separate farm, we have an extra fine lot of Buff Orpingtons, from which we can furnish stock, eggs and baby chicks at popular prices.

MODEL POULTRY FARM Irvington, Alameda County, California

Of all Things needed Fences are First

BECAUSE the fence gradually will pay for the luxuries, season by season. How? By enabling you to turn your waste into cash.

Fence your farm off into a sufficient number of fields to get the proper rotation of crops and the most advantageous pasturing and your *cash returns* each season are bound to increase. The farmer still using the old system of big fields is losing money through waste. The fields of your farm are like tables in a restaurant. The more tables the more people served and the greater the profit.

The steel in Ellwood fence is specially made for the purpose from carefully selected stock. It is hard, elastic, tough and springy. The line wires, composed of two or more wires twisted into cables give each individual wire the shape of an elongated coiled spring. The fence is therefore sufficiently elastic to take care of expansion and contraction, and yet so rigid when properly stretched as to prevent sagging. The small and permanent mesh is made by weaving one continuous wire throughout the fabric. The mesh or stay wires are so interwoven that slipping is impossible. The triangular truss is the strongest form of construction known. For this reason, Ellwood fence will stand hardest usage and still retain its shape.

Ellwood Fence is sold in your town. Look for the Ellwood dealer and let him show you his different styles of fence and quote you his low prices. Get his expert advice on your special needs. He is on the spot, buys in large quantities, gets the lowest carload freight rates, demonstrates quality before your eyes and is the man from whom you will get the most for your money.

FRANK BAACKES, Vice-President and General Sales Agent

American Steel & Wire Company

Chicago New York Denver San Francisco

ELLWOOD FENCE

MADE OF TOUGH SPRINGY STEEL

GERMAIN'S SEEDS ERMINATE

You can buy no better seed than that sold by us, and we are always glad to assist you in selection. Among other extra fine varieties that we recommend are the following

Three 1911 Specialties

CASAD'S Improved Muskmelon

A distinctly new sort that has been firmly established. Slightly netted rind, buff yellow flesh, luscious and smooth, approaching a pineapple flavor. Send for a packet 25 cents.

GIANT Stringless Green Pod Beans

This is a big favorite in the East and has proven a success here. It often produces pods six inches in length, tender and absolutely stringless. Very early. **Packet 10 cents. Pound 35c postpaid.**

GERMAIN'S Winter Queen Tomato

It is the earliest producer of all, and shows a wonderful resistance to frost. Compact bush, fruit smooth, even sized and finely colored, firm flesh. **Packet 10 cents. Ounce 50 cents.**

You should have our 1911 Catalogue—Please Mark Letter Dept. C

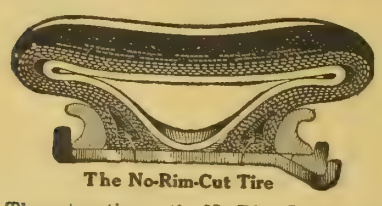
Don't Buy Auto Tires That Hook to the Rim

Motor car owners now are using 500,000 Goodyear No-Rim-Cut tires. They are so popular that our tire sales trebled last year.

And 64 leading motor car makers have contracted for them this year.

These are the hookless tires—the tires that can't rim-cut—the tires 10 per cent oversize.

They are saving motor car owners millions of dollars by cutting tire bills in two.



The No-Rim-Cut Tire

The Ordinary Tire

These two tires—the No-Rim-Cut and ordinary—are fitted on the same rim. This is the standard rim for quick-detachable tires, also for demountable rims.

The difference is this: The removable rim flanges are set to curve outward when you use a No-Rim-Cut tire. They must be set to curve inward—as shown in the picture—when you use an ordinary tire.

These removable rim flanges can be set either way by slipping from one side to the other. So Goodyear No-Rim-Cut tires involve no change in the rim.

Rim-Cutting Impossible

The No-Rim-Cut tire, when deflated, comes against the rounded edge. Rim-cutting is simply impossible. We have run these tires flat in a hundred tests—as far as 20 miles—without cutting the tire in the slightest.

The ordinary tire—the clincher tire—needs to be hooked to the rim. The rim flanges must be set to curve inward, to grasp hold of the hook in the tire. That is how old-style tires are held on.

Note how that hooked flange digs into the tire when deflated. That is what causes rim-cutting. That is why a new tire may be ruined by running a few hundred feet on a deflated tire. That rim-cutting usually adds one-fourth to one's tire cost.

How We Avoid It

We have invented a tire with an unstretchable base. We vulcanize into the base 126 braided piano wires. Nothing can possibly force this tire off until you unlock and remove the rim flange.

When this tire is inflated the braided wires contract. The tire is then held to the rim by a pressure of 134 pounds to the inch.

That is why hooks are not needed. Not even tire bolts are needed. The tire can't come off because the base is unstretchable.

We control this feature by patent. It is the only way known to make a safe, practical tire which doesn't need to be hooked to the rim. It is the only sort of tire which you will buy when you know the facts. For the worry and damage of rim-cutting is now an utterly useless waste.

GOODYEAR
No-Rim-Cut Tires

Tires 10% Oversize

Goodyear No-Rim-Cut tires are made 10% over the rated size. The flare of the tire permits that when the rim flanges turn outward.

We give you that 10% oversize without any extra cost. That means 10% extra carrying capacity. It means, with the average car, 25% more mileage per tire.

Most tires are overloaded by the extras one adds to a car. The top, glass front, gas tank, extra tire, etc., load the tires beyond the elastic limit. That is the cause of blow-outs. It is the cause of one-fourth of all tire expense. This oversize avoids that.

These No-Rim-Cut tires—these oversize tires—now cost the same as other standard tires. They used to cost one-fifth extra.

These two features together cut tire bills in two. You can get them without any extra price by insisting on Goodyear No-Rim-Cut tires.

Our new Tire Book tells scores of things which motor car owners should know. Write us to send it to you.

THE GOODYEAR TIRE & RUBBER COMPANY, 90th Street, AKRON, OHIO

ARNOTT DOUBLE DISC HARROW

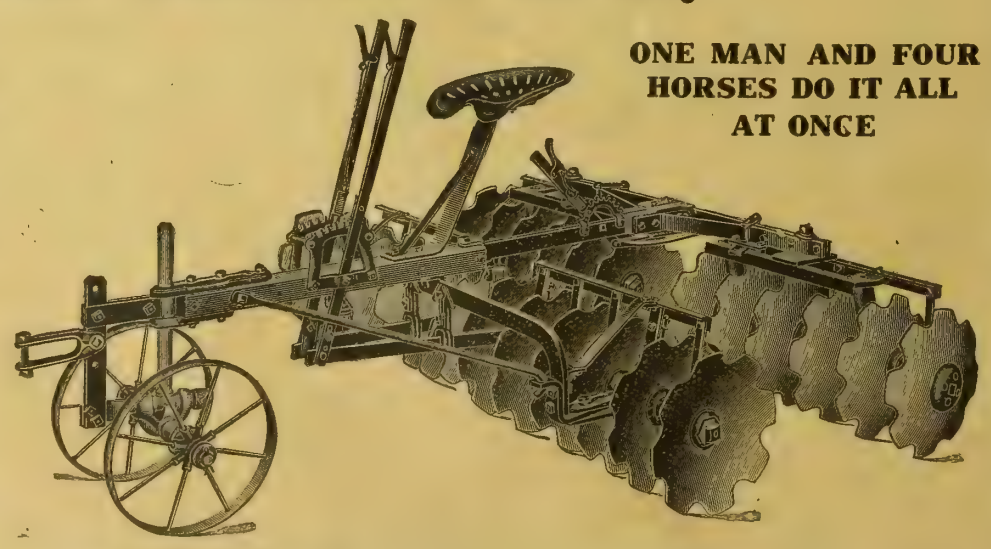
A Plow—A Disc—A Pulverizer—A Smoothing Harrow all in one

The SENSATION of the Day

Compare it Point for Point With Any Disc Harrow Made

Double Gangs
Double Cut
Double Throw
Double Levers

ONE MAN AND FOUR HORSES DO IT ALL AT ONCE



The flexibility of the **Arnott "Double-Cut"** in contrast with the stiff action of other two-way harrows is what is making it so popular. This flexibility is possible because of our Universal Joint connecting the front and rear gangs. For lack of this feature other double harrows have a good deal of side draft and will not make a square turn without digging a great hole. This can't happen on the **Arnott.** Independent front and rear levers within easy reach of rider.

Complete description mailed upon application. Write for prices

ARNOTT & COMPANY, Inc., Southwestern Gen. Agts.

112-118 South Los Angeles Street, LOS ANGELES.

All sizes in stock for immediate shipment, 4 to 10 ft. cut inclusive.

A GOOD LEMON SECTION LITTLE KNOWN.

By Philip H. Rice, Santa Barbara.

For the past eighteen or twenty years I have been identified with lemon growing, and for about ten years, to July, 1910, as manager of the Johnson Fruit Company. At no time of the game did I lose confidence in the ultimate outcome of the industry in this section, and at the time, some four or five years back, when some of the lemon growers were digging up their orchards, I began planting more trees and advocating increased planting. The result of the last few years has justified this advice.

The greatest difficulty that we packers have had to contend with in the Santa Barbara district has been the lack of interest in the essential necessities of the industry by the growers. A lemon orchard, with many, was a side issue, and received practically no attention or care except to kick at the packing house for not returning to the grower what, in his ignorance of conditions, he anticipated receiving. Practically all of our orchards had been allowed to care for themselves, and for years had received very little irrigation, practically no fertilization and cultivation, and the fruit was picked at "any old time" that happened to suit the owner of the grove. Other districts in California, not so favorably situated, had in the meantime employed the best methods of scientific culture, and far outstripped us in quality and output, until the time finally arrived when our district had to face the abandonment of the industry.

Viewed Other Orchards.

At this stage of the game I frankly told our growers what they had to face, and induced a large number of them to go to Whittier and investigate the methods of the orchard and packing house handling that were resulting in profit, and not loss, to the grower. Following this excursion, an immediate improvement was inaugurated, better methods of orchard care began, and in a few months a resultant improvement was noted.

To more fully demonstrate to our growers the necessity of careful handling, both in the orchard and packing house, I aided in inducing the Department of Agriculture at Washington to begin a series of experiments in lemon handling similar to that completed in oranges, with the result that it was fully demonstrated that the secret of lemon growing was care in culture, irrigation, fertilization, and, above all, careful picking and careful handling from tree to packing house. In a measure, this was not new to us who had followed the game for years, but, as the old saying has it, "a prophet is not without honor save in his own country." Nothing we could say seemed to have the weight of the testimony of these distinguished government experts. Growers began to sit up and take notice when it was demonstrated to them that their careless methods of picking and handling were causing them a direct loss of from 10 to 20 per cent of their fruit, to say nothing of the loss of reputation of the shipments from this district.

Improved Methods.

The first improvement to be inaugurated was in the picking gangs, whereby the fruit was picked regularly from the various orchards by a set of men under the direction of a trained foreman, instead of being picked by any men that the owner might be able to employ. This regular and careful picking, with increased care in the packing house handling, the fruit never being touched by the bare hand from the time it left the tree until it was packed for shipment, resulted in a few months in reducing the percentage of decay from 10 to 20 per cent to practically nothing.

Under the old methods, practically all shipments from May 1 to October 1 had to go under refrigeration to all Eastern markets. With the improved methods, in a short time we were able to ship without ice at all times of the year. In the last two seasons no cars of lemons, except some overripe fruit, have gone forward under ice, saving the grower, on this item alone, from $60 to $75 on each car, and in addition to this establishing a rep-

utation for the fruit that it could be safely purchased without danger of decay.

Two "Pools" Necessary.

Before the campaign of education began, some three years ago, it was found necessary to separate the fruit, as delivered, into two pools, in order to give the grower, who did try to be careful, just treatment and a fairer return for his increased expense and resultant better quality. The realization of the advantages of more care has now made the quality of the general average so much better that the double pooling system may soon be abandoned, and a considerable saving in packing house expense assured.

These changes were not effected without a great deal of persistent labor, but the reward was ample when the California Fruit Growers Exchange, about one year ago, publicly acknowledged by circular letter that the output of the Santa Barbara exchanges had changed from the poorest to practically the best in the state.

Lemons Must Have Care.

Now, the point I am leading up to is this: If the Santa Barbara district can produce and ship fruit that will compare favorably with the southern districts, where every possible scientific care in the way of selection of soil, planting, irrigation and fertilization is resorted to, what might not be accomplished if the same care were given to the industry here? I think I am safe in saying that nine-tenths of our orchards have been grown without fertilization, and scarcely a grower in the district has given one-half the care that has been bestowed upon the lemon orchards of the successful southern districts.

We have here the ideal climatic conditions; our trees will thrive with about one-third the quantity of water necessary elsewhere; scale is kept in check by parasites which will not thrive in the warmer climate of the interior, thereby saving from 15 to 40 cents per tree per year for fumigation; frost, except in a very few portions of our district, is unknown—another great saving in eliminating frost protection; damaging winds are rare, and our soil, if properly selected, is so fertile that very little fertilization is necessary. With all these advantages, I fully believe that if we will systematically begin the development of water and the planting of trees in this district, it can become the greatest lemon-growing district in California.

More Water.

One word more. Because we have these natural advantages, we must not expect that our orchards will yield a profit without intelligent effort on our part, or that our land, without water developed, is worth a fabulous price. If we are not willing to go to the trouble and expense of putting our land in condition for lemon planting, then give the man who is willing to risk his capital and labor a chance, for he will see a fair return on such investment, and aid us in developing our productive section.

Spraying Citrus Trees now Obsolete

S. A. PEASE, Horticultural Commissioner San Bernardino County.

For twenty years I have been in some way connected with the experiments and endeavors to rid the citrus orchards of the pests that have in a large measure been carelessly allowed to gain a foothold in California.

In the early nineties, the spray pump was the only known apparatus to use for the purpose of controlling and eradicating these pests. Every imaginable concoction has been tried out only to prove in the end what may be termed a basic fact that no matter what material is used the percentage of scale killed does not exceed 80 to 90 and consequently the live scale remaining intact on the trees, owing to their prolific breeding capacity, is sufficient to be a continuous draft on the vitality of the tree.

Then, too, when some of the oils had been used for a term of years it was plainly evident to the observing man that their continued use was a positive injury to the orchard. I have seen some orchards that were so badly damaged by the spray that it took at least two years for them to recover. And, not only this but good experimenters have determined it to be a fact that oil sprays reduce materially the amount of the coming crops on orchards treated.

The great reason for the long continued popularity of the spray pump was the fact that growers are inclined to look at the seeming cheapness of any operation against scale pests instead of carefully investigating results. However, we have been fortunate in having scientific experimenters in the citrus industry and it has been my pleasure to profit by watching the operations of some I have known. When it was the common practice to spray with distillate I knew of one man who was operating over many acres of orchards who tried it very thoroughly indeed and for a few years thought to make a success of it. Finally not being satisfied with results, he purchased what is termed one outfit of tents and started in to prove to himself the respective merits of the two systems. He fumigated a block of his orchard and sprayed one beside it. This he did for two years, closely watching for results as to fruit and freedom from insects. After the second year I asked him what his conclusions were. This was his reply: "There is only one way and that is fumigation for the very sufficient reason that you get more fruit, better fruit and the fruit carries better. The trees look better, are better and everything is better." After coming to this decision, this man was naturally desirous of getting rid of his dozen or so power sprayers and did so for half-price to those who still advocated the cheaper method.

Other orchardists kept coming to the same conclusions as the above mentioned man until at the present time, I think I am safe in saying that not a single orchardist who can be quoted as an authority remains to uphold the method of spraying citrus trees.

Very fortunately during what may be termed the unsettled period we were able through the efforts of Dr. L. O. Howard of the department of agriculture to secure a man to put in three years of experimenting to perfect the methods of fumigation with hydrocyanic acid gas. And so far did Mr. Woglum advance this work that today the old methods of guess work are being rapidly abandoned. As a result, if he will follow his directions any intelligent man can do good, satisfactory and safe work.

The only proper method now is to use the A. W. Morrill system of marking the tents, the Woglum way of measuring around the bottom of the tent and his prepared schedule of dosage which is printed by the department of agriculture and may be had for the asking.

Our troubles are not entirely over yet, however, for the reason that some of the growers are still desirous of cheap methods and to gain this end they employ any contractor who is willing to take a smaller amount of money than it can be done well for, and pretend to fumigate the orchard. He necessarily uses a smaller amount of chemicals than he should and this leaves many live scale on the trees and not only makes it necessary for the orchardist to have the work done again much sooner but is a constant damage to the surrounding orchards in that they become infested sooner than they otherwise would. This year one of my inspectors who operated two of our outfits of tents, on request refumigated 180 acres done by cheap contract work last year.

Now, when it is considered that a three years' experiment was carried on by the department of agriculture for the purpose of ascertaining just what it takes to kill the different scale insects and how to do it, it is my opinion that public meetings should be held in every locality to pass resolutions by the growers themselves requiring the contractors to do the same as private corporations, that is, mark their tents and use the government dosage as given on the bottom of each schedule.

WHY NOT TURN THAT CREEK OR POND INTO A VALUABLE ASSET

On having sufficient water depends the success of your crops. On the success of your crops—your living.

You can't always be sure of enough rain—but if you have a creek, pond, slough, or other source of water supply you can hitch it up to an I H C Gasoline Engine and pump the water where and when you need it. The cost is slight—the results sure.

Gasoline Engines

are the most economical, efficient power known for pumping water and doing other farm work.

They are simple—strong, and easily operated. They give more power with less gasoline consumption than any other engine.

It's easy to get just the right engine for your particular needs because they are made in all styles and sizes—1 to 45-H. P.; vertical or horizontal—stationary, portable, or traction.

Call on the I H C local dealer, tell him of the work you want to do and let him show you the one for your needs. If you have feed to grind, milk to separate, wood to saw, fanning mill to operate, an engine from this line will meet your needs. Remember—the efficiency of I H C Gasoline Engines has been proved by years of service—they are backed by a company that has a reputation to maintain and could not afford to put out any machine that is not dependable.

I H C Service Bureau

The purpose of this Bureau is to furnish farmers with information on better farming. If you have any worthy question concerning soils, crops, pests, fertilizer, etc., write to the I H C Service Bureau, and learn what our experts and others have found out concerning those subjects.

If you want the I H C Gasoline Engine Catalogue to aid you in your selection, ask the I H C local dealer for it, or, write the nearest branch house.

Economic Factors in Olive Production

J. W. MILLS

Olives have been grown in California for nearly 20 years. During the last thirty years a large amount of capital and labor has been expended introducing "improved" varieties of olives. Between fifty and sixty varieties have been tested, and now the greater part by far of all being planted are the same variety brought to this coast 200 years ago by the Spanish missionaries, and hence we call it the Mission olive. There are different types of the Mission olive, to which we will refer later on.

Ripe pickled olives furnish the chief outlet for the California product. There is a large trade in oil, and always a good demand for the pure article, though there is always room for apprehension as to its being the pure stuff after it has passed through the various channels of trade. It is not always possible to get pure olive oil, even by watching the process from the crushing of the olive to the bottling.

Rev. Charles F. Loop, whom all early settlers of Southern California and pioneer olive growers knew, told me that on one of his trips to Lucca, the Italian city from which olive oil bearing its name is exported, he asked a man of affairs where he could get a bottle of pure Lucca olive oil, as he wanted to take it to America with him. The Italian gentleman informed him that he did not know where he could get one in all Lucca. Crosse & Blackwell, having had adulterated olive oil foisted on them by even their most trusted Italian merchants, sent a trustworthy agent to Italy to watch the process from crushing to packing. He did so, and saw no mixing of oils, though he had the entire process under his observation and watch and key, but it only resulted in a mixture of olive oil and Alabama cottonseed oil. A still hunt disclosed a pipe line running from a reservoir of cottonseed oil on a nearby hill, and coming up through the bottom of the pan in which the olives were crushed. A secluded stopcock within easy reach of a workman was turned on after the olives were partly crushed, admitting the cottonseed oil by degrees and adding it to the oily mass of crushed olives.

When ripe pickled olives sell from 75 cents to a dollar a gallon to the retailer, there is more money in pickled olives than in oil. The culls, after grading for pickles, make good oil, and a large percentage of California olive oil is made in this way.

The Queen olive of commerce is made from the Sevillano, Ascolina, Picholine, Macrocarpa and Polymorpha, the first named being the largest olive grown. These, when well grown, are too large to pickle when ripe, as they turn soft before the lye can penetrate to the pit.

After spending large sums of money and much time trying to find some variety of olive better than the Mission, California olive growers have come to the conclusion that the Mission is the best all-around olive grown.

There are what we know as the large and small Mission olives. The largest sometimes attain the size of a medium-sized Queen olive, but the flesh is firm and of fine quality when ripe. The oil is also of high grade. If handled properly, it is a regular bearer. Our experience in the Sacramento Valley is that if the trees receive enough moisture to make a moderate growth each summer, and the fruit is picked by February, the trees will bear regularly. The soil and climate seem to be particularly adapted to their growth. Some of the finest olives that I ever saw were grown on hardpan land that had been broken through where the trees were planted. On the other hand, trees on a deep sandy loam that dries out readily will not mature salable olives for pickling if not irrigated.

It is generally conceded that the Washington navel orange is subject to a greater number of type variations than any other fruit, but the Mission olive follows a close second, and when soil conditions and varieties of soils enter into their environments, it is surely up to the record of the navel orange. We have Mission olives, all budded on Redding Picholine, that ripen from October to March, all on a five-acre lot. Some trees bear heavily every year, some only every other year, both without irrigation and growing adjoining. Some trees ripen all of their fruit at the same time, and some of them will have half of the crop still green while part has ripened and dropped off.

It has been our experience that if the fruit is picked off before the first of March, the trees will bloom profusely, but if delayed much later, little or no bloom will be the result. We discovered this in a row of trees that had always behaved uniformly, but three trees were left unpicked, having been reserved for a patron who bargained for them on the tree. The olives were not picked till April, and when the balance of the row came into bloom, these three trees had so few blossoms that it was hard to find them. The three trees produced less than three gallons, all told, while those trees picked early produced over twelve gallons per tree. This emphasizes the advantage of grafting or budding from those trees which ripen the fruit uniformly and early.

CANVAS GOODS

We are the largest manufacturers of Canvas Goods in the Southwest; making everything in canvas from a coin bag to a circus top. We carry at all times standard tents of all sizes, and have an immense stock of materials from which we are prepared to turn out special jobs on short notice. Any article bearing our stencil will be found absolutely up to standard as to size, weight and pattern. We aim that our goods shall sustain our reputation, the same having been gained by nearly a quarter of a century's hard work—a mighty long time for this country. First-class dealers throughout our territory carry our goods; but where not in reach, you may purchase direct from our catalogues.

WE MAKE

Lemon Curing Tents, Fumigating, Photographic, Assembly, Living, Stable, Lawn Tents, Tent Houses, Awnings, Canopies.

FUMIGATING TENT CANVAS

We make our fumigating tents of an especially close woven 6½ and 8-oz. cotton goods. This fabric retains the gases better than anything yet produced and affords a distinct advantage to the user of the ordinary duck.

WE MAKE

Fruit Picking Bags, Mail Pouches, Irrigating Hose, Water Coolers, Carry-All Bags, Horse Covers, Bedding Rolls, Stable Blankets, Stack Covers, Nose Bags.

CLOTHING

We make to order Corduroy, Gov't Khaki, Fustian Cloth, and Duck Suits for Men and Women. Send for catalogues.

Handling of Citrus Orchard Soil

W. F. SUTHERST, PH. D., F. I. C., LORDSBUBG.

The citrus grower must endeavor by all means at his disposal to get full benefit from his orchard soil, by utilizing the naturally as well as the artificially supplied material. The mere fact that an analyzed soil shows sufficient mineral plant food to grow fruit for a score of years or so does not mean that full power of the soil will be obtained by the usual cultivation methods.

The tree roots spread out everywhere in the direction of the greatest supply of food and drink, unless, which is most likely to occur, some obstacle puts itself in the way. It is a natural course of roots to divide up so as to cover as much soil as possible, but, of course, this can only occur when the soil is porous. If few openings for the roots are present, then few root fibers grow, as it never happens that two fibers penetrate the same opening. Our first operation is, therefore, to make the ground as loose as possible by cultivation, and, if the soil is a heavy one, by applying long-straw manure, or plowing in hard-straw crops, such as beans. The reason for getting a mass of root fibers is obvious, as in the first place a large portion of the water soluble mineral plant food does not move about with the soil water, but remains attached to the soil particles so firmly that unless a fairly large quantity is present it rerains entirely fixed. This is particularly the case with potash salts, so vital for fruit producing. The roots then must seek their food, and the more root fibers, the more food can be brought to the tree. This is more apparent with the phosphates, which are always in the insoluble form, and the roots must come in actual contact with them. Air is necessary to every living thing, both vegetable and animal, and the growing root tips are in need of it, as any other part. Anyone who has repotted plants will have noticed the mass of roots between the soil and the walls of the pot. This comes from the fact that the terra cotta is porous and allows air to enter, developing the roots to many times the extent there they would in the soil itself.

The orange tree is usually denoted a surface feeder, but roots, like animals, migrate to food (and air) supplies, so if the subsoil received the same treatment as the surface, we should get the roots traveling in another direction. Although there is perhaps more available plant food at the surface, especially after years of cultivation, yet a tree is more certain of withstanding water shortage if tap roots are encouraged, and the greater mass of soil covered by the roots in such cases would more than supply the necessary mineral plant food. Deep cultivation, not necessarily plowing, should then be undertaken, preferably by means of a subsoil plow attached to an ordinary one, the former just loosening the subsoil, so that the air can penetrate. Irrigate at longer intervals, and thoroughly when done, so that the water has an opportunity to soak into the subsoil, and on its way down carry air to the roots. Anything that has a tendency to prevent soil aeration, such as the layer of mud left on the ground after floods, should be immediately removed by harrowing. Cover crops of the long-rooted varieties have been shown by experiment to induce roots of after crops to travel to three or four times their usual distance straight into the ground. The dead cover crop roots leave a channel down which air is conducted, supplying this necessity to the next crop's roots in a region where it never existed before. There is a certain amount of difficulty in bringing fertilizers to the subsoil, but by attaching a distributor behind a subsoil plow this can be easily overcome. Barnyard manure is again more difficult to bring under deeply, so one must rely on the deep-rooted cover crop mentioned above and artificials. Where labor is cheap, trenching might be resorted to, using a trench plow to cut as deeply as possible. This course, however, tends to bring the roots all to one place, and when the fertilizer is all used up, growth is retarded. The same objection is raised to hole manuring—i. e., boring holes of several feet depth amongst the roots of a tree, and filling partly with mixed fertilizers. On most soils there is sufficient potash in the subsoil, and to induce phosphate to reach down, basic slag should be used, this fertilizer having the peculiar property of traveling downwards of its own accord. During rain, a loose soil will hold more; as soon as the soil surface is saturated with rain, further fall runs off, so efforts should be made to keep the surface in an absorbent state by keeping a good depth of soil in a loosened condition. This will mean a saving of irrigation water, as well as a gain by root aeration.

It is doubtful if the practice of cover cropping, especially with shallow-rooted crops, is of such advantage as is usually accepted. Cereal crops, being shallow and fibrous rooted, would be more likely to injure an orchard, whilst it is now known that the leguminous crops do not gather nitrogen from the air, if the soil is in a fertile condition. During the first six or seven weeks growth of vetches they rely entirely on soil nitrates for their nitrogen, and should sufficient be present for further growth, the nodules do not develop. In most cases, then, cover crops simply draw plant food from the depths to the surface, thus encouraging the tree roots to travel along the surface.

Keep the soil loose and aerated to a good depth. This will aid in developing the roots in all directions, in length as well as thickness. This is the most certain way to get abundant and regular crops.

MORRIS & SNOW SEED CO. 425 So. Main Street Los Angeles, Cal.

This open front door makes perfect ventilation

Mandy Lee is Miles Ahead

It is the only Incubator without a "Sealed," Air-tight Egg Chamber. It supplies the life-giving oxygen freely, draws off the carbonic acid gas, and is saving the lives of millions of chicks.

READ the story of the Mandy Lee triumph in our new catalog. Other incubators are already preparing to imitate and profit by our great discovery.

No guessing with a Mandy Lee

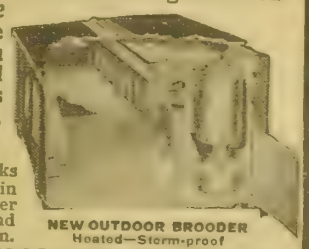
You cannot afford to buy an old-theory incubator which may go out of date and be discarded next year. You should know the truth *now* about the great discovery. The book is free. Ask for it.

There IS Something New in Incubators

We have taken the boldest and most important step ever taken in incubator building. See the openings into the egg chamber? They mean the saving of chicks' lives. It is the key to *right* hatching. Ventilation in the Mandy Lee is now perfect. It goes on all the time, neither above nor below, but right *at the eggs*. Every minute of the hatch the life-giving oxygen is freely passing in to the eggs and the carbonic-acid gas is passing out. And correct ventilation is just one of the great Mandy Lee features.

We Don't Guess—We Measure

The Mandy Lee is as far in advance of other incubators in heat and moisture as it is in ventilation. We do not guess at anything. The sensitive regulator controls heat to the fraction of a degree and *we measure moisture* just as accurately with the Mandy Lee Hygrometer (one sent with every incubator). You know what you are doing. *You* measure and control moisture; *you* control the hatch. The Mandy Lee is the all-season, all climate, all condition hatcher, always producing the most and the strongest chicks.



NEW OUTDOOR BROODER
Heated—Storm-proof

Mandy Lee Brooders give direct contact heat to the backs of the chicks. That is *real* mothering, the most important thing in poultry. Hovers are raised and lowered as weather gets warmer or cooler—heated from end to end. Chicks do not pile up and smother. Write to-day for catalog and full information.

ICING CHARGES REDUCED.

As we go to press the dispatches announce that in a decision by the Interstate Commerce Commission in the case of the Arlington Heights Fruit Exchange against the railroads the charge of $30 a car for precooling oranges is reduced to $7.50 a car, to take effect April 1. Manager G. Harold Powell of the Citrus Protective League is reported as saying: "This is the greatest victory the citrus growers have yet achieved."

CITRUS OUTPUT OF THE WORLD.

From G. Harrold Powell, manager of the Citrus Protective League, we have an article contributed for this issue on the necessity of co-operation on the part of citrus growers. Like some other matters, it has been forced over till a later issue, yet we must quote its first paragraph which touches upon the citrus industry of the world.

"The citrus fruit industry probably represents the largest single fruit industry in the world. There will be not less than 165,000 car loads of citrus fruits entering into international and domestic commerce during the present year. California will supply nearly 50,000 cars of oranges and lemons, Florida 10,000 cars of oranges, Spain 40,000 cars of oranges, Italy 10,000 cars of oranges and the equivalent of between 50,000 and 60,000 car loads of lemons shipped either as fresh fruit or converted into citrate of lime, lemon oil, or other by-products. The rest of the citrus fruit crop will be shipped from Spain, Portugal, Syria, Jaffa, Cuba, Porto Rico, Jamaica, the Bahamas, Mexico, Japan, and a few other countries. California is a long distance from the centers of consumption and has to pay on the average about 90 cents a box, freight and refrigeration, on the entire crop that leaves the state. The average freight rate from the foreign countries to the points of consumption varies from countries like Spain and Italy, from 18 cents to 36 cents a box. The labor in California costs from two to four times as much as it does in European citrus fruit producing countries and in many of the other sections where lemons and oranges grow."

THE MAGNITUDE OF IT.

Our readers may notice the line across the top of the cover page which states that California will ship nearly 50,000 cars of citrus fruits this year. This is according to estimates made by the California Fruit Growers Exchange a few weeks ago. To be more exact, the figures were about 48,000 cars. Californians are so prone to express facts in big figures that they some times fail in conveying the impression desired. To aid in this instance, if our readers will take their pencils and figure a bit, they will find that 50,000 cars of citrus fruits a year means practically 140 cars every day in the year, Sundays included; one hundred and forty cars daily means six cars every hour of the year; to reduce still more, one car of oranges and lemons will leave this state every ten minutes from November 1st to October 31st. If they were sent in one trainload every day, that train would be over a mile long. Great is the citrus industry.

NOT SATISFIED.

We recently had a letter from Mr. W. H. Schureman, secretary and manager of the Indian Hill Citrus Association, in response to our request that he give us some information regarding the problems of the packing house man. He replies in effect that he is unable to discuss the problem with us because of the fact that that one of the biggest "problems" was now before him in trying to prevent decay which is showing so excessively and so early. Mr. Schureman adds: "Our pack has been fortunate so far in that respect, but I am almost afraid to look at inspection reports for fear we will soon 'get ours.' We are not satisfied with having our pack 'as good as anybody else's; we want our pack the best."

The Indian Hill policy is worthy of widest copying, and surely growers marketing their fruit through that association should join its manager in this effort to make the fruit shipped from that packing house the very best. That of itself will be an incentive to neighboring packing houses to go them one better if possible, and so on, with beneficial rivalry until near perfection shall be reached.

NEAR PERFECTION.

The last sentence above reminds us of a complaint appearing in the Florida Grower. The complaint is made forceful by a few figures. In the month of December, 1909, New York City consumed of Florida oranges 253,618 boxes, of California oranges 48,350, of Porto Rico oranges 58,995, or a total of 360,693 boxes. Remember this is in the month of December when California is hardly in shipping form. However in December, 1910, the same market, New York City, consumed of Florida oranges 241,085 boxes, of California's 97,802, and of Porto Rico's 63,905, or a total of 402,792 boxes. It will be noted that a material increase, over 41,829 boxes, was made in consumption, yet a decrease of Florida oranges of 12,533, a more than doubled consumption of California's and a slight increase in Porto Rico's. The Florida Grower infers that this increase may be due to an advertising campaign of the California growers. Without discussing the question of a more attractive pack or of difference in quality of fruit grown in California, we may at least give the figures to convince California growers of the necessity of always raising quality. The Florida industry is showing greater intelligence than ever before; it has even reached the stage of co-operation, which implies greater intelligence. Advertising, more attractive pack, closer culling, all are surely coming to Florida. Porto Rico likewise is increasing its output, and both have the advantage over us in transportation. It is unprofitable to pay freight on culls, yet some occasionally go forward. Let us take Mr. Schureman's motto and have "our pack the best."

FROST PROTECTION.

It has appeared until last week that the preparations made for frost protection this year would not be given a test, but last Thursday morning the smudge which covered the orange growing districts showed that some orange growers had been up in the small hours of the night. The temperature dropped close enough to the danger line to warrant giving the oil pots and stoves a test, and so far as we know, they made good. The result was not only an actual rise of temperature during the colder hours, but a smudge protection from the direct rays of the morning sun.

We doubt not more general preparation was made this season for frost protection than ever before. This feature of the citrus industry is comparatively new, though some efforts at frost protection were made as far back as 1892. All imaginable methods have been tried, "direct heat," smudging, steam, irrigation, and even lattice screen. The smudge and direct heat people have lasted the longest, and now we believe it is generally conceded that a combination of these two methods gives the best results, direct heat during the colder hours of the darkness and smudge the last thing before sun-up to prevent injurious action of the sun's rays.

We believe this feature of citrus growing, and of practically all fruit growing, will be improved in method until but few orchardists are unprepared. When that time comes it will be a comparatively simple problem, for now it is the few energetic growers who have to bear the burden of "warming all outdoors."

NORTHERN CITRUS FAIR.

The Western Fruit Jobbers in session in Sacramento last week saw an example of the wholehearted way in which California opens its arms to the visitor. It was a great session and the citrus exhibits from the northland were surprising. That oranges may be grown successfully over a strip extending north and south for nearly 600 miles, amazes everyone on first appreciating the fact. Northern California makes its greatest stake in deciduous fruit shipments. Its fresh fruits have reached every market in the United States, and its reputation as a citrus fruit producer has grown with the years, and for exceptionally early fruit will be a stronger factor as the industry develops.

The winners of the gold, silver and bronze medals are as follows: Pioneer Fruit Company of Sacramento, gold medal for best display of citrus fruits; Butte County Citrus Association, silver medal for second best display; Exeter exhibit, silver medal for third best display; Porterville Chamber of Commerce, bronze medal for fourth best display; Butte County Citrus Association, bronze medal for fifth best display.

CITRUS GROWERS CONVENTION.

It is fortunate that in our edition especially devoted to citrus culture we may refer to a great gathering which will take place at San Bernardino beginning Tuesday morning, March 7th. It is in the nature of a state convention of fruit growers, or to be more explicit, of citrus producers. The meetings will be under the direction of the state horticultural commission. This will permit of the publication of the proceedings by the office of the state commission. The list of names announced for the program carries assurance of a great feast. We trust we may give program in full in our issue of March 2nd.

The demonstration train begins its trip for Southern California on February 23rd, at a different point than ever before. The starting place this time is Lone Pine, Inyo county. From there the train will work its way down the line to Mojave, Newhall, Lancaster, San Fernando, reaching Los Angeles Saturday night, February 25, where the train will Sunday. Monday morning it goes on to the San Gabriel Valley, Pomona and Riverside, and later takes the usual Imperial Valley trip, then the Orange county and Coast trips, completing the season's runs.

The Florida Fruit and Produce News under the guidance of Mr. Edgar A. Wright, formerly of this state, has been greatly improved and now makes a change of name to the "Florida Grower." It should be an inspiration to the Florida growers to produce and ship better fruit.

Florida growers are combining to fight the dreaded whitefly is an indication of an awakening to the seriousness of the situation. California can be none too vigorous in the enforcement of its quarantine law and none too drastic in treatment of any infestations in the state.

Agricultural News Notes of the Pacific Coast

Northern California

Snow in Lassen county caused the death of much stock on the ranges.

A thousand acre tract has been subdivided at Wyandotte, Butte county.

The Butte County Citrus Association made a big exhibit at Sacramento.

Many new settlers have located in Glenn county during the last season.

Gridley colonists are working for legislation more favorable to drainage districts.

Timber land owners of California have formed a co-operative fire protective association.

Sacramento Valley Development Association is planning for a $50,000 advertising campaign.

Guinda, Yolo county, almond growers plan the construction of a storage and packing house.

A new orchard of 1000 acres is being planted at Healdsburg. It is largely of prunes and Gravenstein apples.

A big warehouse is being constructed at Paradise, Butte county, by the Paradise Fruit Growers Association.

Many Sacramento Valley nurseries have been exhausted of pear and almond trees and Oregon nurserymen are finding sales.

Almond growers of Guinda, Yolo county, marketed 268,337 pounds of almonds last season for which was received $33,979.05.

Horticultural Commissioner Galloway of Sonoma county reports most of the nursery stock of that county as in excellent condition.

Grain growers have asked the state legislature to aid them by establishing demonstration farms showing advantage of dry farming.

The citrus fair at Sacramento made a complete showing of citrus possibilities of Northern California before the Fruit Jobbers Convention.

Orchardists at Paradise, Butte county, have planted an unusual number of Bartlett pears; also several thousand apple and almond trees.

County Horticultural Commissioner Stabler of Sutter county reports large planting of orchards and vineyards. All nursery stock in excellent condition.

The secretary of the grape growers association at Lodi reports shipment during the last season of 221,356 crates of grapes which brought a gross price of $186,280.

Farmers at Princeton, Colusa county, have pledged 2240 acres for beet growing and the hope is for a beet line railway to the sugar factory at Hamilton.

Farmers near Redding, Shasta county, are still having trouble with the Balaklava smelter which it is charged is not obeying decree of court regarding poisonous fumes.

Great increase in the average production of the dairies of Humboldt county has been effected by the action of the Ferndale Cow Testing Association. Monthly tests are made.

Sebastopol Apple Growers Union has incorporated and filed articles with the county clerk. The directors are: J. W. Turner, C. E. Hotle, W. I. Newcomb, Walter Elphich, J. R. Rosie, W. N. Couch, Edward E. Murford, J. J. Alves and Edson C. Merritt.

Central California

Kern county will ship about forty cars of oranges this season.

Poultrymen of Santa Cruz county are working for a lower egg shipping rate to San Francisco.

The Kings county board of supervisors has been petitioned to appoint a squirrel inspector.

The Directors of the Kings County Fair Association have set upon the last week in September as fair week.

Kingsburg raisin growers still holding largely of last season's output, are selling occasionally at three cents.

The discussion over the horticultural commission situation in Tulare county seems to wax warmer instead of reaching a sane conclusion.

The break in the Kings river levee near Laton caused some damage, but the good from the precipitation far more than outweighed it.

A carload of bees at Porterville recently made life miserable for passengers in a train which stopped alongside.

The Salinas Valley is waking up to the value of irrigation, many wells having been sunk there in the last three years.

The Turlock Irrigation District was damaged by the washing out of 70 feet of concrete lining near the head of its system.

Raisin cartons labeled two pounds but which contained only 24 ounces are the cause of contention amongst raisin packers.

Members of the Farmers Union of Fresno county have concluded to employ Greek laborers as less objectionable than Japanese.

The regents of the University of California have sold the crop of raisins from the Kearney estate lands to the J. P. Armsby company.

The recent run of the demonstration train through the San Joaquin Valley found especial interest manifested in olive culture and hog raising.

The Farmers Union of Mountain View, Santa Clara county, at its meeting last week, discussed best methods of eradicating ground squirrels.

A campaign of education along the lines of marketing, warehousing, and controlling raisins has been started among Fresno farmers by the county Farmers Union.

The people of Fresno have decided on April 30th as "Raisin Day" this year. The raisin growers are to be asked to contribute to the success of the campaign on the basis of about 25 cents per acre.

Fresno County Farmers Union has elected the following officers for the coming year: F. W. Abbott, Oleander, president; J. H. Bonesteel, Kingsburg, vice president; Lea W. Taylor, Selma, secretary-treasurer.

Dr. Rupert Blue at the head of the movement to exterminate ground squirrels, has informed the growers of Monterey county that the government proposes to exterminate the rodents on all government land.

The new livestock inspector of Tulare county is requesting all veterinarians to notify him of any infectious disease, and he will make especial effort to have the county released from the Texas fever tick quarantine.

Southern California

Escondido has set 700 acres of new vineyard.

Farmers' institute will be held at Placentia tomorrow.

Ventura county's lima bean output averages 22 sacks per acre.

Escondido has established its first agricultural course in its high school.

Orange county estimates she will plant 30,000 acres of beets the coming season.

Imperial county proposes to have a slice of the $18,000,000 good roads bond money.

A rancher at Elsinore, Riverside county, is engaging extensively in the production of angora goats.

Southern California's lima bean acreage in 1910 was 60,000 acres; Ventura county claims 35,000 acres.

About 20 acres of mountain land have been planted east of Julian, San Diego county, to western yellow pine seed.

The Oxnard Sugar Company has printed and distributed valuable information for the use of sugar beet growers.

Rapid progress is being made in the levee along the lower Colorado river to protect the water system of Imperial Valley.

The date trees in the experimental plantings at Heber, Imperial county, produced about 3000 pounds of fine fruit last season.

Fifty farmers of Holtville, Imperial county, have organized a co-operative creamery company with a capital stock of $20,000.

Redlands dismissed her schools and the college students all escaped during a heavy snowstorm which visited that section last week.

It is claimed that the potato famine in Southern California has been broken by extensive shipments of eastern potatoes into Los Angeles.

San Fernando people are planning for a water carnival to be held on completion of the $23,000,000 aqueduct of the city of Los Angeles.

Land owners of Riverside county have failed in their suit against the Lake Hemet Water Company and the Fairview Land and Water Company.

Engineers for the Riverside Water Company have spread the storm waters of the Santa Ana river over hundreds of acres of gravel lands near Crafton.

The state horticultural commission has quarantined all the cotton seed coming from outside the state and demanded most thorough fumigation before it can be delivered.

The sale of the 43,000-acre El Sobrante Rancho near Corona, Riverside county, gives hope to the people in that section that many settlers will be attracted to those lands.

Experts at Oxnard, Ventura county, report the average production of beets per acre in that section is 31,487 beets to the acre, whereas the normal or rather the ideal stand is 43,560, or one to every square foot.

Friends of the Chucawalla Valley are pleased over the passage of the bill, now signed by the president, permitting the construction of a dam across the Colorado river near the mouth of Pyramid canyon.

The Coast

Arizona sheep men report range feed abnudant and sheep doing exceptionally well.

Extensive plantings of apple orchards are being made near Pullman, Washington.

Fruit men of Forest Grove, Oregon, met and endorsed the Canadian reciprocity treaty.

The first association for testing cows in the state of Oregon was formed at Forest Grove.

Cattle men of Arizona are greatly pleased over prices prevailing and the demand for their stock at this time.

Self government has just been inaugurated by the students of the agricultural college at Oregon.

D. D. Rucker near Phoenix, Arizona, has a cow which gave birth to a quartet of calves, all doing well.

The Oregon sheep industry represents an investment of $23,750,000. There are 2,441,000 sheep in the state.

A bill has been recommended to the Oregon legislature granting counties power to make appropriations for local fairs.

Alfalfa ranches near Phoenix are new cutting their winter crop. These ranches are proving exceptionally profitable.

Orchardists of the Kennewick district are making extensive preparation for frost protection at apple blossoming time.

The town of Nephi, Utah, claims to have been the banner town for showing interest in farmers institutes in that state.

Grain fields of Eastern Washington are reported in the best of condition with absolutely no winter killing up to this time.

The annual convention of the wheat growers and millers of Washington was held at the state agricultural college at Pullman last Saturday.

Great numbers of cattle in Lynn county, Oregon, have been dying of meningitis, and appeal is made to the state veterinarian for relief.

The government experimental farm at Sacaton, 25 miles west of Florence, Arizona, has produced some exceptionally fine Egyptian cotton this season.

The largest oat crop reported from the Northwest is claimed by Theodore Harmes of Lewis county, Washington, and is 224 bushels from a single acre.

A thousand farmers from three states gathered at Walla Walla last week to form a more perfect organization for co-operative buying and selling.

The elevation of water in the Roosevelt dam in Salt River, Arizona, reached 131.65 feet on February 13th. The reservoir now contains 269,213 acre-feet.

The legislature of Idaho has passed a bill permitting dams to be constructed on the north fork of the Clearwater river in the aid of irrigation in that section.

The farmers of Twin Falls, Idaho, have formed an organization for the purchasing of high-grade stock. This is to secure better prices for the products of their farms. Heretofore they have sold their hay and grain. They will try feeding.

1911 SEED CATALOG

If your name is not on our list, please send us your address for a copy. It is a good one, well worth having; sent free and postpaid. We have secured the California agency of the

Prairie State Incubators

The best—bar none. First carload selling fast. Come in and see them—or send for Prairie State Catalog. We also have a carload of the

Baby Buckeyes
50-Egg Incubator for $7.00

Purchaser can operate it for forty days, and if it does not meet with his entire approval, it may be returned to us and the price paid will be promptly refunded. They go like hot cakes. If you cannot come in, send for a Buckeye Catalog. When the chicks are hatched, don't forget the old reliable

West Coast Chick Feed

Let me send you my big, new, 1911 Old Trusty book and confidential personal letter right away. Tells you how much less than $10 I charge you this year for one of my world-famous Old Trusty Incubators—freight prepaid east of the Rockies. You see, I'm working on 100,000 machines this year on a makers profit of only 7% or less, so I can put the price way down even though I always keep up my highest standard in workmanship, materials, and guarantee 80% hatches or better. And my 10-year High-Quality Guarantee is Johnson's—backed by all Johnson's property. cash, factories and

OLD TRUSTY a lifetime reputation for square deal on Old Trustys. When I made only 50,000 Old Trustys I had to charge 16% profit, but chicken raisers, both beginners and experts, have bought so many Incubators from me that they forced my factory capacity up to 100,000 and I'm giving it back to my customers by keeping only 7% or less, profit now on each machine. Old Trusty is better and surer than ever this year. Handsomely metal encased and asbestos lined. Hundreds of thousands in successful use now—3 times as many as any other made.

Practical Poultry Culture

THE BEGINNER IN TURKEY-CULTURE.

Many novices in turkey-culture are dreamily meditating over the remunerative reward they will reap, writes Mrs. M. M. Robinson, in Rural Home. They may fancy that they are on the road to "easy" street, for they have boldly sailed out on the sea of turkey-culture, keeping several hens and counting every egg gathered as one poult worth so much cash. They do not realize any of the numerous details that must be promtly attended to; they can see nothing to prevent smooth sailing. Such people are destined to be failures.

It is well and good for them to be enthusiastic about their work, for there never was much accomplished without enthusiasm; but they must study the practical side of the proposition and learn to labor and to wait before their dreams can become realities. You cannot make an expert turkey-culturist without practice any more than you could make an expert lawyer or doctor without experience.

You can get many invaluable suggestions from poultry publications. The information you can acquire from these sources and the exercise of good judgment on your part and constant application to your work are sufficient equipment for you to begin the business in a small way. If you are lucky enough to have any friends who are experienced and successful in the business, seek their advice. Never fail to heed the advice of successful people, but do not listen to roll-top-desk theorists, or you will get into a dilemma. Yes, learn all you can from reliable sources, begin the business in a small way, and ere long you will acquire a practical knowledge of the business and your future success will be assured. Having familiarized yourself with the business, you can rear birds successfully on a large scale. The following suggestions will be of service to beginners in turkey-culture.

Of course you have selected your breeding stock before this, which should have been the very best procurable.

The eggs should be gathered daily and placed in a box lined with flannel, the large ends up.

Feed the hens plenty of food to keep them in good health, but see that they do not become too fat; if they do, feed boiled oats. They should be fed some shell-producing food. Supply plenty of grit and water.

Most turkey hens will lay more eggs than they can cover; set the remainder under chicken hens, but see the hens are not infested with lice.

Place a common V-shaped coop over the turkey before she hatches, and when you remove her from the nest put her in a dry place accessible to the sunlight. Keep the mother hen in the coop until the poults are large enough to follow her, but let the poults go in and out of the coop at will.

Before you remove the hen from the nest give her a good dusting with insect-powder as a precaution against lice.

Let the first feed of the poults consist of well-baked corn bread, soaking it in sweet milk and squeezing it dry before feeding. When they are three or four days old begin feeding them a ration of finely cracked corn and wheat. An occasional feed of cheese made from clabber milk by stewing it can be fed to good advantage, and good beef scraps, cautiously fed, will produce good results.

Drive them home every evening, feed them, and see that they roost at home. The following morning feed them again. You will thus keep them growing, keep them from straying from home, etc. They should also be fed in the middle of the day.

Freshly made sour-milk cheese may be fed sparingly the second week, and after that may constitute a large portion of the food, if it can be had. Up till the end of the third week about the same quantity of hard-boiled eggs should be fed—not the same proportion, by any means, but about the same number of eggs to the same number of poults.

Care should be taken not to feed too often nor too much at a time. Every two hours the first week and five times a day the next two weeks will be often enough. No more should be given at a time than will be eaten at once, for stale, sour food will cause bowel trouble quicker than anything else. On this account no more should be mixed up at a time than is required for the one feed. Sloppy foods of all kinds should be avoided, but this does not mean that everything should be fed dry. As a matter of fact, young turkeys do not take readily to dry food. It is best just moist enough to be crumbly without being in the least soft.

After the first few days they may be given full liberty after the dew is off. When rain threatens, or cold, damp days, they should be kept yarded. In very small yards the grass may be easily kept down with a lawn-mower, but I prefer a good-sized yard with a calf or two or a few sheep in it. It is often quite as much a convenience for calves as turkeys, especially where calves are raised by hand. But a yard I would have for turkeys, even though small. Until large enough to go on the perch they should be yarded nights and on wet days—at night to protect them from wild animals, and wet days to keep them from dragging around in the wet grass outside.

GOOD COUNSEL ABOUT GOOSE-RAISING.

There is very little to choose between the two most popular varieties of geese, the Toulouse and Embden, both being excellent for utility purposes, and, when bred up to standards, are marvels on the show bench, writes W. R. Gilbert, in Michigan Farmer. The Gray Toulouse appear the largest, but when placed upon the scales the White Embden are quite equal, and very often excel in weight, and the first cross from an Embden gander and Toulouse goose, or vice versa, will produce goslings weighing twenty-five to thirty pounds at Christmas time. I give preference to the gray goose and white gander, as the Toulouse lay more eggs as a rule, and seldom have a desire to sit, laying often forty eggs in a season. Of course these eggs have to be placed under hens, and here the incubators are very useful, as many a valuable gosling has been crushed in hatching, especially by close-sitting hens and geese.

The Gray Toulouse goose should be as large, massive and deep as possible, squarely built, with broad shoulders and grand bow in front. The

Incubators and Brooders

The evidence is conclusive that the PETALUMA is the best Incubator buy that can be made. The best value for the money ever offered and is appreciated most by those who have had varied experiences with other incubators. Why? Because it hatches such large, strong vigorous chicks. More Petaluma Incubators were installed in the large hatcheries last year than all other makes combined. No other incubator in the world has a hatching record to equal the Petaluma.

1st Ckl A. Y. P. Ex. 46 Wash. Ave. San Jose Cal

exhibition standard calls for very large head and immense gullet, which develops considerably with age; color should be a dark steel-gray, with each feather laced with almost white edging. Flights must be solid gray, free from any white; the stern and paunch white. Toulouse geese are most prolific, laying a large quantity of eggs during the year, seldom, if ever, becoming broody, except occasionally at the end of the season.

The Embden is totally different in shape and appearance, being very close and solid in body, very broad in breast, with no inclination to bow in front, also no keel, but should have a very long, swan-like neck, large head, which is quite clean, and perfectly free from gullet. The Embden is pure white in plumage but, as in the cygnet, a few gray feathers are allowed in the gosling, which will all molt out pure white after the first year. The Embden usually lays ten to twelve eggs and then becomes broody, but will not lay again that season if allowed to hatch and rear young. They are excellent mothers and hatch out successfully if not too heavy and are undisturbed. They will lay three or four batches of eggs in one season if broken away from nesting each time.

Geese, if suitably mated, will live and breed successfully for several years and, when once well mated, should not be parted. Some have been known to live and breed for twenty years, but ten years is quite usual. The Toulouse and Embden increase in size and weight up to three or four years old, and can be made to reach the following weights: Ganders, thirty-four pounds; geese, twenty-five to thirty pounds; but twenty-two-pound ganders and nineteen-pound geese are quite heavy enough for stock purposes. Forcing for heavy weights ruins them for breeding. Stock birds do well on grass, poor grass suiting them best, and they will greatly help and improve it, but should have a feed of oats once daily, or, if laying very heavily, wheat or oats mixed with bran.

Goslings are very little trouble after the first week. They are slow to take food at first, living entirely upon the yolk of the egg. I then place them in a coop with the hen or goose, on very weak or poor short grass, if possible, where goslings have not been reared before. Their first food should be chopped egg mixed with dry biscuit meal, adding a little whole or crushed barley, not allowing them to swim or get into water (except in very hot weather) until two weeks old. If they are hatched early and in cold weather, cut sod and keep them indoors for a few days before placing them out upon the lawn or grass. They will soon take to the grass and thrive well on a feed of whole barley, wheat or meal once a day. Observe that the grass is not too rich and sour for them. The geese will always take to the goslings at the end of the season, but will soon stop their laying if allowed to take to them earlier.

ALFALFA MEAL IN FEED.

In a dry mash or a moist mash. Following formula is good and uses considerable proportion of alfalfa, about all that the birds will eat readily:

Ground alfalfa	20 pounds
Coarse wheat bran	20 pounds
Corn meal	10 pounds
Wheat middlings (white)	10 pounds
Barley meal	10 pounds
Gluten feed	10 pounds
Meat meal or scrap (sweet)	10 pounds

—American Poultry Journal.

Alfalfa will not take the place of wheat or oats. It may be fed freely as a bulky "green" food, about the same as clover, but it is not quite as well relished as good clover, and the results obtained are no better than, if as good as, those obtained by feeding best quality clover. Analysis: Fiber, 25.0; ash, 7.4; protein, 14.3; nitrogen, free extract or carbohydrates, 42.7; fat, 2.2.

Advice to the beginner in poultry is to start in a small way and learn the lesson well, using every effort to get good results. This calls for care, watchfulness and well-applied business principles.

Plumage of old fowls tends to shade lighter with increasing years.

—?—?—?—?—

The POULTRY QUESTION Solved

——If you have been hesitating about raising poultry on account of food difficulties, be assured that you need delay no longer.

Start now--You can succeed

The poultry outlook is better than ever before and there is a big demand at all seasons.

We are the largest poultry food manufacturers in California and our success is due to results obtained by feeding our products. They are right in every particular.

Our Special Chick Food ——is just what young chicks need. It is what they naturally look for.

Our Growing Chick Food ——is a strength giver and body builder. It is the ideal food to bring young chicks to a healthy maturity.

Our Egg Food ——supplies the necessary ingredients for making eggs and keeping laying hens in full vigor.

Our Scratch Food ——gives the flock the variety of grain, etc, necessary for vigor and continued health.

We are manufacturers and distributors of the most perfect poultry food to be had any place at any price. If you will give our foods as directed you will have no trouble in raising chickens for eggs and market.

We have solved the problem for you

Ask for **COULSON'S FOOD**

Insist on getting it if you want the best.

Our goods are sold by all reliable poultry supply houses. If your dealer cannot supply you, write us and we will name our nearest agent.

Be sure to write for our book "Poultry Feeding for Profit." It is instructive and entertaining. Also contains a list of poultry remedies and supplies. Write today for a copy.

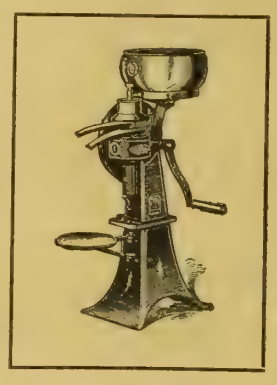
DE LAVAL
an honest capacity
CREAM SEPARATOR

All separators are rated at so many pounds of whole-milk per hour.

DE LAVAL machines range in capacity from 1350 to 135 pounds of whole-milk per hour, and the price depends largely upon capacity.



We make the claim that under any and all conditions a DE LAVAL machine rated at 450 pounds capacity will skim as much whole-milk in an hour as any "would-be" competitive machine rated at 600 pounds per hour, and we have proved this statement so often in actual contests, that it has come to be an accepted fact by all well-informed dairymen.

Every DE LAVAL separator is tested for capacity before it leaves the factory, and we guarantee every machine to separate its full rated capacity.

Before you buy a Cream Separator See and try a DE LAVAL

Have one set up at your house and test it alongside of any other machine you like for capacity, cleanness of skimming and ease of operation. We don't ask you to buy a DE LAVAL upon "claims." We do ask you to be sure and give it a trial before you purchase any separator.

Catalog and full particulars of our "free trial plan" gladly mailed upon application.

CHEESE MAKING.

By Mrs. M. E. Sherman.

When the curd is perfectly formed and springs under the knife, take the knife and put it straight at one side of the pan to the bottom. Cut straight across every half inch. Then cross-cut in the same way. Take the pan to the range, putting it on to heat with an asbestos mat under it to prevent burning. Heat slowly, stirring gently until thermometer reaches 98 degrees. Then let the fire go down, or remove the pan to a side table out of draughts. Cover it closely to retain the heat, and after thirty minutes examine the curd. Make a small ball in the center of the band, squeeze it gently together, if it falls apart as soon as released the curd is cooked enough.

Taking Up.

Push the curds to one side and bale out the whey, using a china cup. This is safer for the future cheese flavor than to use the kitchen dippers. The dippers are liable to taste of soup and onions, not to their discredit, but lowly flavors must not taint the savory mellowness of the cheese. Put a large platter on the table, stand the cheese ring on it. Put a square of cheese cloth into the hoops large enough to completely cover the curds. The muslin should be new and must be well scalded and can be put in wet. Roll up your sleeves and freshen the hands and arms with some warm water. Take up the curds by the handful, press gently together and let the whey drain. Put the curds carefully to the bottom and fill the ring by gently pressing so that there will not be any irregular places on the bottom sides.

Pressing.

When the ring is heaping full, fold the ends of the cheese cloth over the curds and put on the follower inside the ring. A simple lever can easily be made to press the cheeses. A six or eight foot scantling will answer the purpose for a cheese this size. Stand the chopping block close to a window, or a strong box will answer; put on it a clean board and several thicknesses of folded flour sacks. Put the cheese on this; place a board on the top and on this a brick. Put the end of the scantling under the edge of the window sill and lay it across the top of the brick that rests on the cheese. Make a weight of about twenty-five pounds by wiring together wornout plow shares, slipping them by a wire loop over the scantling. The pressure on the cheese is regulated by the distance the weight is placed from the end of the lever. At first the weight is close to the cheese, later at the very end; while the curd is soft, too heavy pressure is injurious to the texture.

Treatment.

After five hours in the press, take out the cheese, remove the cloth and gently wash off the whey with warm water. If this is not done the cheese will be sour tasting; rub the cheese dry, now bind the cheese around the outside with a strip of firm muslin, after having scalded out all the starch. Have the muslin wide enough to fold about an inch on the top and bottom. Draw this bandage firmly and lap about four inches. Fold the edges down on to the cheese and lay on top and bottom the circles of cloth. Scald the tin rings well and cool them, wiping them dry. Slip it over the cheese. Stand the cheese again on fresh flour sacks. Slip the weights half way to the end of the lever and leave the cheese for twenty-four hours.

Salting.

The brine way I like, as it is simpler and seems to make a cheese that does not crack readily in the curing. Make a brine by boiling water enough to cover the cheese, using all the salt that the water will dissolve. When the brine is cool put the cheese into it, submerging completely. After about a half hour take up the cheese and wipe it dry, and grease. Dry salting is done by rubbing with fine salt thickly. Turn the cheese after twelve hours and salt the other side. After twenty-four hours take up, then cover the cheese with salt twice a day for six days, keeping it covered with a cloth between time. Either way will make the cheese salty enough to be palatable. When the salting is completed the curing begins.

Curing.

Brush and wipe the cheese smooth from salt and lightly run over it with melted butter. Put on a clean bandage and fresh end covers. It will not pay in cheese making to wash out and use again on the cheese the old covers, as they are weakened by using. Turn the cheese daily, and twice a week examine to see if it is cracking. When cracks appear take off the cover bandages and grease again, then if the cracks are deep use fresh made flour paste and put a paper patch across the openings to exclude the air. Put on fresh bandage and the trouble will probably be at an end. The curing room should be an airy, dry place where the temperature is about 60 degrees. The cheese is ready to be cut in six weeks, or it may be wrapped in several thicknesses of brown paper and then in a tin box to keep away mice until used up.

Warning.

Heat is the enemy of the cheese in curing; it is, therefore, better to have a temperature below 60 than to have it above it for a period.

The pressing is simple enough if it is remembered; lightly at first and increasing as the green cheese grows firmer until it reaches the maximum.

The bandages on the cheese can be greased every other day if the cheese starts to crack badly.

Cold draughts often give trouble in making the cheese dry irregularly.

If it is preferred, the salting can be done in the curds after they are drained and before placing them in the rings or hoops. Use four ounces of salt to every ten pounds of cheese.

An error is made by stirring the uncooked curd too much. This causes the cream to escape in the whey and makes the cheese poor and tough.

In making cheese as in making butter, it is wash! wash! wash! be clean! and then after everything is clean, make it clean all over again for safety. It reminds me of the small boy who had a stepmother. A prying neighbor asked him if he was happy. Jimmy said "yes." Then questioned the neighbor further, saying: "Jimmy, does she whip you?" "No, but she does a precious sight worse," replied Jimmy. "Hum! What's that?" "Why," replied Jimmy dolefully, "she jest washes me all over every morning." —M. E. Sherman.

DECAY IN TRANSIT.

Mr. Powell's work in the Citrus Protective League has a wide scope. While he has nothing to do with the marketing operations, each shipper and the exchange handling its business as it may think wise, yet his suggestions as to loss prevention in transit are in order. On this point Mr. Powell is fully qualified by his long investigations to advise. He recently sent a circular to citrus growers, from which we quote:

"After the 1st of February the decay in citrus fruits while in transit is likely to increase. The fruit is riper, more tender, and therefore more susceptible to injury; the weather is warmer, and for a time may be more humid, and as the shipments during February, March and April become heavier, the work in the groves and packing houses is forced to the limit, and unless systematically checked is likely to be carelessly done. A sound orange with an uninjured skin does not decay; bruised oranges are almost sure to rot, under the conditions outlined. This is the time of year when every organization, every grower and every shipper ought to stop and look into its own operations to see whether the fruit is handled with enough care to prevent injury and decay.

"A sound orange not only ships in sound condition, under any method of transportation, but it remains sound in the hands of the jobber, the retailer and the consumer. A bruised orange may be transported in sound condition if it is iced or precooled quickly after picking, but it is likely to rot as soon as it leaves the car and becomes warm and moist enough for the decay to develop.

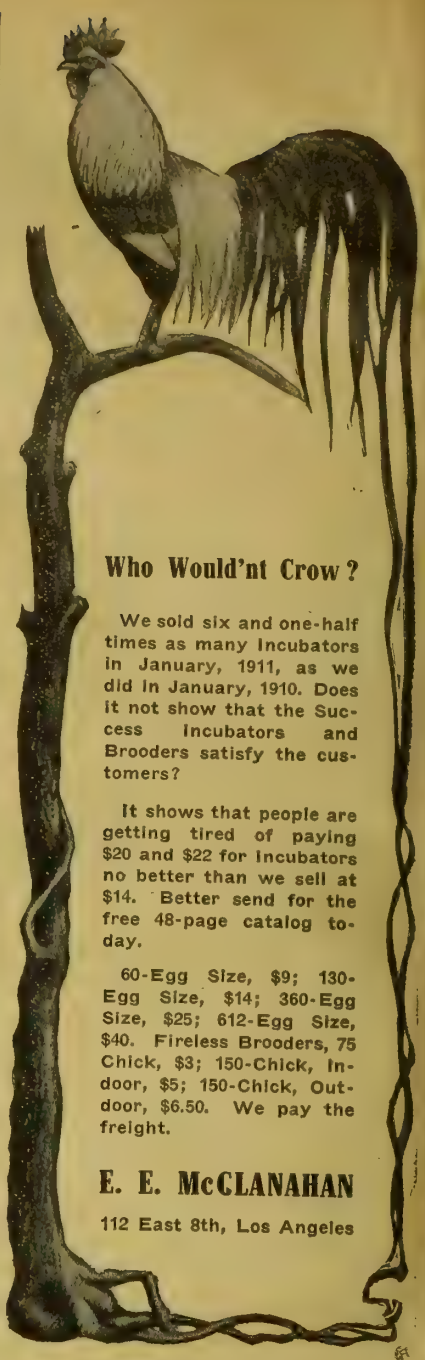
"The careful handling of the California orange and lemon crop is a business question. There is enough involved in it to cause every grower and shipper to give it serious consideration. Formerly, the loss from decay in transit was estimated to vary from three-quarters of a million to a million and a half dollars annually. It is much less now. This money, in addition to the freight paid on the rotten fruit, has been practically thrown away. It can be added to the earnings of the citrus fruit grower, as the most common losses from decay are preventable by the careful handling of the fruit.

"The decay question has been investigated by the United States Department of Agriculture for several years, and many of the growers and shippers understand it. Many of them do not. There are others who understand but who do not practice the teachings of the department. The principles underlying the decay in citrus fruits are therefore restated.

"The most common decay in citrus fruits while in transit is caused by blue mold, a low form of plant life, which cannot grow through the healthy, vigorous epidermis of the skin. It belongs to a class of organisms which grow on dead or weakened tissues. Blue mold on the skin of a vigorous, sound orange is in the same condition as barley would be if sown on an asphalt pavement; neither can penetrate the tissues or the soil beneath. They are similar, also, in that neither can grow in a good soil without heat and moisture to germinate them. The blue mold, though, will grow slowly at a temperature as low as 32 degrees Fahr., though its development is greatly retarded in a temperature of 40 degrees Fahr.

"Practically all the decay in transit is the result of bruising and injuring the fruit during its preparation for shipment. Clipper cuts, stem and gravel punctures, finger-nail scratches and rough handling in the packing houses—these are the most common forms of injury.

"The Federal Department of Agriculture has spent thousands of dollars in co-operating with the citrus industry in establishing the principles of good fruit handling. It has shown that the lemon and the orange will keep for months and can be shipped in sound condition if the fruit is handled properly during its preparation for shipment; but the government can never do for the grower and the ship-



Who Would'nt Crow?

We sold six and one-half times as many Incubators in January, 1911, as we did in January, 1910. Does it not show that the Success Incubators and Brooders satisfy the customers?

It shows that people are getting tired of paying $20 and $22 for Incubators no better than we sell at $14. Better send for the free 48-page catalog today.

per those fundamental operations which they only can perform. It has helped to point out the causes of decay. It remains for the industry to handle its operations in such manner as to make the findings of the government effective.

"The control of the decay is a business proposition. It is practical to control it, but it is not an easy question to handle. It is not self-regulating. It is related to the methods of paying labor, the methods of fruit picking, and to all of the business practices that surround the handling of the fruit. Any system of labor handling or of business management that places a premium on the quantity, rather than the quality, of work performed, is likely to lead to decay. The careful handling of the fruit is unusual, unless the grower, the organization or the shipper has provided some method of enforcing it. It must be the business of someone to see that careful handling methods are habitually practiced. In the end it depends on the man who handles the labor, and he must have the strong support of those who employ him, or decay cannot be escaped.

"Now is the time to stop and see where you stand. Your oranges are as likely to be in the crippled and injured class as those of your neighbor. Unless your whole system of business places a premium on the care with which the work is done, the chances are more than even that you will find from 10 to 40 per cent of your fruit injured in the various operations of handling.

"The Citrus Protective League stands squarely for the conservation of the earnings of the citrus fruit grower. It does not believe that the citrus industry can afford to lose a million dollars a year from decay, or any considerable proportion of that amount. It knows that the principal losses from decay are avoidable. Every grower and shipper is therefore urged to consider this question now, before the favorable season for decay sets in. Standardize your picking so that all of it is done with care. Make it someone's business to enforce careful handling. Be careful of the picker who is paid by the box. Look out for the man who picks over fifty boxes a day. Be careful of the loading, the hauling, and of every operation in the packing house, from the unloading of the fruit to the final loading in the car. Watch the fruit of each grower where it is pooled through an association. The oranges of one may show 2 per cent of injury, while the fruit of another shows 40 per cent. See that the points of the clippers are round, instead of pointed. Watch the emptying of the fruit from the sacks. See that the grove is fumigated next year, if the oranges have to be washed. Eternal vigilance is the price of sound fruit, but every grower and every shipper can have it if he will devote as much attention to it as he does to the culture or selling of the crop. In short, study your whole system of doing business, and determine the relation of each operation to the care with which the fruit is handled. A system that insures careful handling leads to better work in every department of the citrus fruit industry. You are urged to take this matter up with your labor, your association, your directors, your shipper, or with anyone in authority, and give it critical attention from now on."

A GOOD BUSINESS.

A characteristic story is told of the late Thomas Flatley of Boston, the well-known Irish lawyer and wit.

He was acting for the defense in a divorce case and during the cross-examination of the plaintiff asked the following question:

"You wish to divorce this woman because she drinks?"

"Yes, sir?"

"Do you drink yourself?"

"That's my business, said the witness angrily.

Whereupon the lawyer, with face unmoved, asked one more question:

"Have you any other business?"

HIS PHILOSOPHY.

The Sage: After forty years o' married life I've made up me mind it doesn't matter how often a man an' his wife disagrees, as long as he don't let her know it.—Harper's Bazar.

GROW BLIGHT RESISTANT WALNUTS

A Celebrated Tree Which is Being Used to Extend Profitable Walnut Planting. The Chase Tree at Whittier Regarding which the Department of Agriculture Makes Good Report.

No disease among the fruit and nut bearing trees of Southern California has elicited more apprehension nor called forth greater effort in its solution and cure than the blight of the walnut. Its study has engrossed the best talent of the State University and also that of the federal agricultural department, nevertheless up to the present time no remedy nor preventive has been discovered; the only hope being to breed a race of trees that shall prove immune to its attacks. The disease is recognized by black sunken spots on the hulls of the young nuts, usually more pronounced at the blossom end. As the fruit develops these several spots seemingly amalgamate, covering considerable areas of the surface, until the nut becomes a disgusting black mass and is utterly destroyed. At about this time the disease also shows itself in a similar manner on the leaves and new wood. It has been demonstrated that it is caused by a bacterium which has so far resisted treatment, hence the only hope of maintaining healthy bearing trees is to breed stock that shall at least be reasonably, if not wholly, immune.

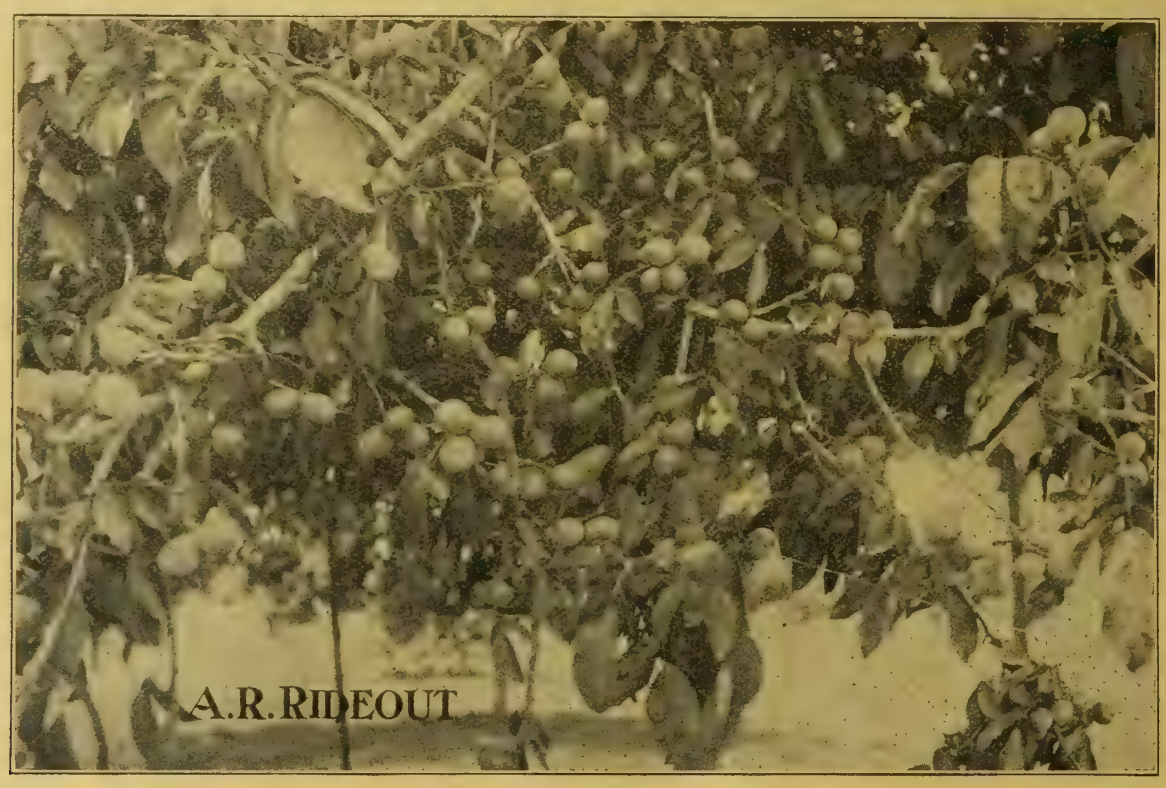
In this direction the walnut industry is not without hope. Recently it was the pleasure of The California Cultivator to inspect several walnut groves in and about Whittier planted to trees that were almost wholly immune from tangible evidences of the blight. These were all planted to grafted trees from the celebrated Chase walnut tree, (a reproduction of which will appear in an early issue of the Cultivator), while the bearing quality of these young orchards at five years of age is shown in the illustration herewith. The discovery of the blight-proof tree is due to A. R. Rideout, the popular nurseryman of Whittier, who at once recognized its economic importance for grafting purposes. Its salient features are indeed pronounced. Planted the same time as the remaining trees of the orchard, it has outstripped them all and now stands head and shoulders above its neighbors grown under similar conditions. Its vitality is remarkable. Being pruned extensively every year for grafts for the past six years, it nevertheless grows and thrives under this severe cutting. And as a large quantity of the bearing wood is being cut off annually, it has not of late years equaled its record of 325 pounds made before it was twenty years old. Still each year it has a large crop and no failure. Last year this tree yielded nearly 300 pounds, and though a little blight was slightly evident, an horticutural expert said upon looking it over carefully that it would not lose one per cent of the crop. At the same time, trees adjoining lost one-third and possibly one-half of the entire yield, thus showing a marked degree of immunity and a big stride toward solving this blight problem. Besides its immune properties, its bearing quality and vigor, this tree has other features of note. Its foliage is large and dense, which protects the nuts from sunburn. It is heavily laden with pollen, a point so necessary for well filled and matured nuts. The nuts are well sealed and well filled, thin shelled and of a fine flavor, and are unusually large on the trees.

So much for the parent stock and its superb value; let us now say a word for the young groves coming into bearing planted to trees grafted with wood from the Chase tree. For the most part these are indeed perfect specimens not only in habit of growth, vigor, bearing capacity and quality of fruit, but what is of much more importance, almost absolutely free from blight. The Benchley Fruit Co. of Fullerton purchased the grafted nuts from the young orchard, saying they were the finest and commanded the highest price of any other nuts purchased by them this year. A sample was sent to the department of agriculture at Washington and very flattering reports were received from there. To show that we are not alone in this opinion we quote the following from the pen of State Horticultural Commissioner Jeffrey, in a recent publication of his office:

"I had the opportunity of seeing a twenty-acre walnut orchard planted to grafts from a resistant tree. No such crop of walnuts was ever seen before upon five-year-old trees. An average of twenty-five pounds to the tree was the estimate made by one of the parties, and such magnificent specimens! (Since the crop has been harvested it has been ascertained that some of these trees bore as high as 80 pounds of nuts), all of the same type and every tree distinctive. The Chase strain is one of the most vital and productive in the state. Of course, one cannot advertise this tree to be absolutely free from blight, and I am glad Mr. Rideout does not do so in his article."

As to what will be the final result of these young orchards no one can tell at this time. Until scientists work out some scheme for making walnuts immune, all growers can do is to plant varieties showing the least damage and the most productive and finest nuts. Of these the Chase walnut grafted trees are not excelled by any with which we are acquainted. Out of the whole 20 acres there was one walnut that had the blight very badly, and a few that showed it slightly on a few nuts, but these were marked, says Mr. Rideout, and he is cutting graft wood only from those in the orchard that showed no signs of blight on the nuts or wood, thus furthering the picking from the immune of the immune and thereby working out the absolute immunity. It is understood that he has the budding wood from the original tree and you[illegible] orchard for four years. Next season he expects to have at least 20,000 grafted trees, a goodly portion of which is already contracted.

There can be no question but Mr. A. R. Rideout is doing the walnut industry a real service in disseminating the fact that there are walnut trees practically blight proof, as well as in propagating and distributing the trees themselves. No one planting a walnut grove can afford to take any chances on stock of questionable character as regards this disease. Having seen the orchards and examined them The Cultivator feels that the facts are worthy of exploitation in its columns. In spite of that, however, it suggests to those contemplating planting walnut trees to investigate for themselves, thus becoming witnesses to an important horticultural discovery of vast economic value to the walnut industry as a whole.



THE PROLIFIC RIDEOUT WALNUT TREES IN BEARING.

Showing the remarkable annual crops produced by this superb strain of walnut trees, because practically immune from the enervating effects of the blight.

FACTS About Opportunities in the Great

Owens River Valley

Open Letter to Cultivator Readers

Los Angeles, Cal., Feb. 18th, 1911.

With all the success we have enjoyed in selling our Owens Valley land there has been no one medium that has brought to this office more buyers than the "California Cultivator." This condition has proven one thing, that it is Southern California farmers—more than any other class of farmers—who can fully appreciate all the merits of our Owens Valley land. It is only by comparison that we can judge anything. Consequently it is the farmer who has had all the trials and tribulations of the water problem who can fully realize all the merits of this beautiful new valley.

You have doubtless read many of our advertisements, and possibly received some of our literature, and feel that we have made some very bold statements about what this new land is capable of producing. We have been criticised for using bumper crops as illustrations of what the land will do. In answer to these criticisms, we wish to go on record as saying that we firmly believe that all record crops in Owens Valley will be beaten by the new incoming farmers.

Farmers who know modern methods of cultivating and irrigating, who have kept in touch with progress, have learned the wonderful principle of conserving moisture in the soil, would only have to see the simple methods that have been pursued by the old farmers of Owens Valley, to realize, that to apply modern principles would greatly increase the yield of the land.

Most Fertile Spot in Southern California

We do not believe the resources of Owens Valley have been discovered. Every trip into the valley seems to disclose new conditions. In a small way we have found farmers growing celery equal to the best produced in the market. We are constantly coming into contact with the farmer who tells us about his unusual currant and gooseberry crops; another farmer will tell about a wonderful crop of cherries growing on a few trees. Then again we find evidence of the most remarkable production of almonds, and so on, until we become more fully satisfied than ever before that the Owens Valley, in a few years, will have the reputation of being the most fertile spot in Southern California. It is our firm belief that by virtue of these conditions, Owens Valley land, with a good water supply, will be selling for four or five hundred dollars per acre in a very few years.

With our many years of experience in selling farm land, we have never come in contact with, or heard of, a land selling proposition that showed such a high percentage of buyers, for the number of people who have investigated the land. We venture to say that nine out of ten persons that have left this office have purchased.

Of course we have made a special point of endeavoring to interest people in apple growing. We sometimes feel that by devoting our entire energies to exploiting apples, that we have given some people a wrong impression of the Valley, to have them think that they could not grow other things equally as well, but our one idea in talking apples is, that we realize the large profits to be made in developing an apple orchard. On the other hand, we sometimes feel that we make a mistake in not encouraging people to go in for trucking, bee culture, and poultry raising. We know, by proven facts, that the Owens Valley honey is equal to any, and superior to most honey that is produced in this state. We see evidence of the fact that conditions could not be more perfect for poultry. If you could view the wonderful poultry farm of Mr. Fred Eaton, you would exclaim that you never saw White Leghorns with feathers so white, legs so yellow, and combs so red.

Talk With Men Who Have Bought Land

We appreciate that all we say is as nothing compared to what some disinterested man would say, who has studied the Valley. Some man who did not have land for sale, and consequently would make little difference to him whether you bought or not. For this reason we are going to give you the names of some of those, to whom we have sold, together with their addresses, and the number of apple and pear trees they have ordered, and are now on their way from North Yakima, and which will be in the ground by the first of March. Possibly some of them live in your country, and you will be able to talk with them.

Mr. Burns	Nebraska	480 "
Mr. Williams	Anaheim	740 "

Our Mr. Hanson, a fruit grower of twenty years' experience, and who knows nursery stock, if any man should know it, made a special trip to North Yakima to buy these trees. He stopped at all the large apple shipping points in both Oregon and Washington, returned with the exclamation that there is nothing in those two states that is superior to our land. That first-class apple land in any of the proven districts sells from $250 to $400 per acre.

Proven Apple Land

In claiming that our land is proven apple land we make this statement knowingly. Although we believe that the entire Owens Valley is good apple land, it is an established fact that there is about 30 miles from Lone Pine, North, which is superior to all the balance of the valley. Superior in the fact that it is not so liable to killing spring frosts as the northern portion. Our lands are in the center of this 30 mile stretch. In making this statement we wish to say in all deference to the northern part of the country that they only have to introduce smudge spots to have a full crop every year. However, one should grant that to get into a country where this is reduced to a minimum is much better than otherwise.

Valuation According to Production

No doubt the hardest thing for the farmer to solve is "Why is land in Owens Valley worth $150.00 per acre?" Most people have heard of Owens Valley only in the most remote way, and liken it to some distant place where the country is undeveloped, and consequently expect very cheap land. We do not think there is a first-class farmer in California who does not believe that the time is rapidly at hand when farming land will be sold according to its ability to produce, just as business property is valued according to its ability to command certain rentals. To tell you of some of the remarkable things that have been done in Owens Valley would make you feel that such things are unbelievable. The story comes to us that 800 tons of alfalfa was taken off 97 acres, 80 acres of which was cut three times and 17 acres twice; that upon a special eight acres 34 tons of baled alfalfa was taken off on one cutting, and that this alfalfa was tied over the back of an average size horse.

We have in our office timothy hay with 18 inch heads. This hay goes two tons to the cutting and sells for $11.00 per ton.

Ideal Climatic Conditions

After everything has been said about what Owens Valley will do in the way of raising crops, a matter that is quite secondary to some, but most vital to others, is, "What kind of a place is Owens Valley to live in?" To those who consider that farming is simply a means to an end, and that end is a comfortable home, peace of mind, and an opportunity to educate the children, then we say, Owens Valley possesses more necessary qualities than any other section in California we know of. The climate in Owens Valley is ideal; we do not mean to say that it is 100 per cent perfect, and that they never have a disagreeable day—such a statement would be foolish—but we do say that taking the summer all the way through, it is equal to the best climate Southern California can produce. By that, we do not refer to the hot section of Southern California, but those sections which we all know to have beautiful summer climate. The winters show an extreme cold of about 10° colder than Southern California. This, however, only means the early morning. It is a universal remark that by 10 o'clock all men are in their shirt sleeves. Although such a thing as scenery is quite secondary to good farming, it is certainly acceptable when one can have it, and there is little doubt that Owens Valley is as picturesque as any place in the state.

We have instances where men have come into our office to get prices on our land with a "bee in their bonnet" that they want to own an apple orchard. We have discouraged such men in buying land, where we knew they were not qualified to make a success of their purchase. We have no desire to put people on our land to have them turn out a failure. They would never blame themselves. On the other hand we earnestly solicit first-class farmers, and it is to the modern farmer we invite inspection. You readily see that if we deliberately solicit from the most modern farmer an inspection of our land, that we must feel that we have the land to show.

Write for Descriptive Literature

We have an assortment of literature, a little booklet entitled "Fortunes in Apples," which gives a very complete story of the apple industry, and also tells a vivid story of the condition of our lands. We also have a little folder, "Questions Asked and Answered," in which we have taken questions from a hundred letters and answered them. We did this with the hope that we would be able to answer all the questions asked without being forced to resort to very lengthy letters. It will be our pleasure to mail this to you upon your request. We desire this printed matter to get into the hands of people who are interested.

If you have the time and inclination, we would much prefer to have you write us a letter and tell us what the condition is you are seeking. Possibly you prefer to raise hogs and alfalfa; if such is the case, we are liable to tell you a story about alfalfa and corn that would open your eyes. Perhaps you have some friend who is thinking of making a change in his location, to whom it would be our pleasure to send some printed matter.

If you have not time to write us a letter, fill out the enclosed coupon and mail to us. If printed matter is not forthcoming in a few days, drop us a postal. Sometimes these coupons get lost. Do not hesitate to ask questions.

Planet Jr.

Get double the present results from your time and labor. Use Planet Jr farm and garden implements, and secure bigger and better crops with less work.

Planet Jrs do the work of three to six men. They do it more accurately, and cause a greater yield. They are the result of a practical farmer's 35 years' experience. **Fully guaranteed.**

No. 6. **The newest Planet Jr Combination Hill and Drill Seeder, Wheel Hoe, Cultivator and Plow,** opens the furrow, sows any kind of garden seed accurately in drills or hills, covers, rolls down, and marks out the next row—all at one operation. Perfect Wheel-Hoe, Cultivator and Plow.

Planet Jr 12-tooth Harrow, Cultivator and Pulverizer is a wonderful tool for berry-growers and market-gardeners Works deep or shallow without throwing earth on the plants, and pulverizes the soil thoroughly. Invaluable wherever fine close work is needed.

You can't afford to miss the 1911 illustrated Planet Jr 56-page catalogue. **Free and postpaid.** Write today.

Queries

Questions to be answered in this department should be received at this office one week before reply is expected. Write plainly on one side of the paper and sign full name and address. Unsigned communications receive no attention.

Spray for Codling Moth.

Please give a spray for codling moth infesting apple trees.—C. A., Los Angeles.

See Cultivator of November 3rd, formulas 23, 24, 25 or 26.

Temperature of Incubator.

Many of my chicks die three or four days after hatching in incubator. The trouble is white diarrhoea. What is the cause?—Subscriber.

Trouble of that kind with such young chicks is probably caused by poor heat regulation during incubation. More than that we could not give a reasonable guess without more particulars.

Green Feed for Hens.

Will hens lay and do well without green feed? Is alfalfa meal a good substitute? Will citrons be a good feed?—Subscriber, Ceres.

Hens will not do their best without green, succulent feed. Alfalfa meal is good, and with green bone makes an especially fine feed. For preserving healthfulness of a flock, however, if something like lettuce, Swiss chard, green alfalfa or similar crop can be supplied, it is a great aid. Citrons are of little food value, but will help to keep the hens in healthful condition. Ground alfalfa meal possesses most valuable of food constituents.

Borers.

Because of my prune trees losing their leaves every season on account of red spider, many of the younger trees are sunburned. Where they are not too badly burned is there any method of restoring their vigor and preventing borers from gaining access to trunks?—Subscriber, Colusa.

Our first suggestion would be to eradicate the red spider, information regarding which is given in this department. The trees which are already sunburned should be protected from further injury by shading or wrapping trunks. The burned portion may be protected by whitewashing with mixture of 30 pounds lime, 4 pounds tallow, 5 pounds salt, with enough water to make flow well. This is an excellent protector from sunburn as well.

Capacity of Pipe.

How many miner's inches will be discharged through two-inch pipe connected with four-inch pipe with 10 foot and 20 foot pressure, providing no one else is getting from the main line at same time? Again, suppose two parties were getting water through two-inch pipes at same time from same main, one of the two-inch pipes 1000 feet long with 30-foot pressure and the other 2000 feet long with 40-foot pressure —J. E. R., Oroville.

This query was referred to Mr. J. B. Neff, who answers:

"When 2-inch pipe is used, pipe to be smooth and clean, the discharge will be as follows:

10 feet head, 1000 ft. long, discharge 231 gallons per minute; 2000 ft. long discharge 230 gallons per minute.

20 feet head, 1000 ft. long, discharge 323 gallons per minute; 2000 ft. long, discharge 320 gallons per minute.

30 feet head, 1000 ft. long, discharge 400 gallons per minute; 2000 ft. long, discharge 390 gallons per minute.

40 feet head, 1000 ft. long, discharge 447 gallons per minute; 2000 ft. long, discharge 430 gallons per minute.

If the pipes are well connected with smooth fittings and there is a plentiful supply of water there will be but a trifling difference when both are running at the same time. Common usage allows 9 gallons per minute for one miner's inch. The above is for pipes in the best condition and when the smaller pipe is connected with the larger by a taper joint. In ordinary practice the discharge will vary and is usually only about 65 per cent to 75 per cent of the quantity given."

Figure on Painting This Spring

A second short flax crop keeps linseed oil up, but the increase in price in pure white lead paint is not so great as you may fear.

Get at your dealer's the cost of 100 pounds of "*Dutch Boy Painter*" White Lead, 4 gals. pure linseed oil, 1 gal. turpentine, 1 pint turpentine drier—this makes 8 gallons of old-fashioned paint.

Compare this cost, either by the gallon or by the job, with what you used to pay for paint.

You'll find the difference so small that you can't afford to put off painting, or to paint with anything except "Dutch Boy Painter" White Lead. Write for free "Painting Helps No. 626

Veterinary

Answers in this column by Dr. Fred G. Matthews, are without charge. For immediate mail answer remit $1.00. In writing questions give full symptoms or particulars of injury of animal.

Discharge from Nose and Lameness.

A horse which has a sore on his hock jerks the leg up high when moved in the stall, and groans as if in pain. When taken out of the stall he is lame the first few steps and then lameness disappears. White matter runs from his nose and while drinking he manifests pain by occasionally elevating the head and continually moving one front foot.—Subscriber, Glendale.

Have a qualified veterinarian examine this horse at once, for an infectious disease. A catarrhal condition of the nose associated with sore spots and swelling of the limbs, especially of the hind limbs, is highly suspicious of a dangerous disease.—F. G. M.

Abortion.

A fine Jersey red sow raised her first litter of ten pigs; was bred again but lost the pigs after six weeks; and at the next breeding miscarried after three weeks. She has a good run and is with other sows which carry full term.—Subscriber, Santa Cruz.

This sow is subject to habitual abortion or has some chronic disease of the generative organs, probably the latter. If too valuable as a brood sow to butcher, allow her to go unbred 10 or 12 months and then ten days before service give the following powders, each containing potassium iodide one scruple, nux vomica half scruple, and cinchona bark one drachm, twice daily in the feed for eight days.

Legal

Edw. L. Payne, attorney, 301-304 Douglas Building, Los Angeles, will answer legal queries in this department.

Immediate mail replies cannot be given except where fee to Mr. Payne is paid. When replies are wished in Cultivator address query to 115½ N. Broadway. Los Angeles.

To Center of Road.

If a man buys a certain number of acres, has he to pay too for the strip of land the county road takes away? Road was dedicated to the county some 20 years ago.—Subscriber, Norwalk.

What the purchaser pays for is purely a matter of agreement between himself and the seller, and it would be impossible to give a more definite answer to your general inquiry.

After one has bought a piece of property and made his bargain with his eyes open, he can hardly complain if he has failed to observe that a road comes off of the property, and that he has paid for the acreage in the road at a stipulated price. If he discovers that he is buying a road before he has made his bargain he has his option to complete the deal or refuse it.—E. L. P.

We may add that when a section or square mile is surrounded by road, one-half of it is taken from land on either side, hence the land is described as running to center of road. We think such custom usually obtains in this state, excepting sometimes in case of subdivisions into small parcels of high-priced land, etc.

Statute of Limitations.

Please state if a note given me in summer of 1906 without any payments being made has expired, or how long is it good yet? Also when does note secured by chattel mortgage outlaw? —Subscriber.

Your note expired, or will expire, four years after it became due. It does not make any difference how the note is secured. The Statute of Limitations begins to run against it as soon as it becomes due.—E. L. P.

TREES — ***LARGEST STOCK ON THE PACIFIC COAST***

All Varieties--- All True to Name

We are authorized Commercial Propagators and call particular attention to

The Formosa Plum
Largest size, heart-shaped and light cherry red in color. Best grower and shipper on the market.

FARM LANDS FOR SALE.

For Sale—By owner, good farm land, $50 per acre, in Merced County, 9 miles from Merced and ½ mile from station on S. P. and 4 miles from La Grande on Santa Fe. This land is a rich, sediment soil, situated in the Artesian Belt and an abundance of water is thus assured. Is level and all under cultivation. No alkali, and is suitable for figs, corn, alfalfa, beans, and all farm crops. Will subdivide in lots from 40 to 1000 acres. This land is very cheap at the price. In fact, it is only one-half the price of other land in same locality. For further particulars, call or address Paxton, 612 Lankershim Bldg., Los Angeles.

For Sale—In Riverside County, California, near Elsinore, 435 acres, 25 acres in olives, balance good grain and hay land, well and windmill, plenty of water 22 feet below the surface, barn, small house. $50 per acre, one-half cash. 60 acres, 6 acres in olives, 13½ acres in apricots, bearing trees, balance of land good for fruit or grain. House, barn, fruit house, 3 wells, windmills and reservoir. $5000. A. G. Hayes, 2809 Eliot St., Long Beach, Cal.

For Sale—$125 per acre, 160-acre ranch in Owens River Valley, 2 miles from county seat. 12 acres Stayman Winesap apples, 50 acres alfalfa, 60 acres farming, balance pasture. Entire ranch soil suitable for apples and pears or farming and alfalfa. 100 inches water continuous flow, non-assessable. Would consider one-half exchange in Southern California. Address Owner, Box 52, Independence, Cal.

24 Acres in the Famous "Orland Project," 18 acres alfalfa, 6 acres bearing oranges; all irrigated by the U. S. Government; Orland's best soil; small residence, barn, dairy-house, etc.; right in town, and will double in value in a short time; worth $12,000 now if cut into city lots. Will sell for $8,000 for a short time. Address owner, J. Vance Wilt, Box 71, Orland, Cal.

If You Want a Fine Home, No. 1, rich, level land, close to best market in the state, best climate, where irrigation is not required, write me. I have a few 80 and 160-acre tracts at $10 per acre. Also a fine 160-acre relinquishment for $500, if taken quickly. Wm. T. Mantz, Pattiway, Cal.

For Sale—50-acre alfalfa ranch, 30 acres fine stand 2d year, 20 easily seeded, 40 H. P. pumping plant, good improvements, North of Corona. Price $17,500 including 3 brood mares, 1 cow, 4 heifers, wagons, implements, etc., immediate possession. Might take $5000 cash, $7500 in trade, balance mortgage, 6 per cent. Herbert F. Clark, Hollywood, Cal.

For Sale—A 20-acre farm for $20 cash and $20 a month; possession now; $90 to $125 per acre; your crops pay for the land. Rich, level land for alfalfa, oranges, almonds, grapes, cows, chickens; abundance of ditch water, for irrigation, for $1 an acre a year. Where else can you get this? In Oakdale Colony, near good town and railroad station, climate delightful. T. Wiesendanger, 207 S. Broadway, Los Angeles, Cal.

For Sale—815 acres in San Luis Obispo County. A typical dairy ranch. Plenty of wood, water, irrigable land, buildings, fenced and cross fenced. Orchards, vineyards, oranges, lemons and walnuts do exceedingly well here. Forty acres of land suitable for these. Price $21 per acre. For further particulars apply to Mrs. F. A. Clink, Pozo, Cal.

San Joaquin Valley alfalfa land for sale with railroads, schools, electric power and cheap water at hand. 40-acre tracts and up at reasonable prices. Also several large stock and alfalfa ranches with artesian water. C. H. Biggin, Pixley, Tulare Co., Cal.

Irrigated Land—The famous Gridley Colonies. Improved lands, best homeseekers' proposition in California. Write for particulars. Gridley Land Co., Gridley, Cal.

Cuba—Most productive soil. Delightful and healthful climate. Ample rainfall. Cheapest transportation facilities to the world's greatest markets. Particulars free. Sanderson, 13 Palace Building, Minneapolis.

For Sale—Near Lancaster, Cal., bargains in improved and unimproved land. Also relinquishments for sale or trade. Some homestead land. A. S. Burnham, Box 451, Lancaster, Cal.

Apple Orchards—Large and small, in the only apple producing section in California. The greatest section west of Missouri River. Write for booklet. Geo. W. Sill & Co., Watsonville, Cal.

Parker & Sternberg live in the San Fernando Valley and sell bargains in Ranches, Houses and Acreage. Office 310 Brand, Glendale, Cal. Write or call.

For Sale—160 acres Imperial County, two miles from Palo Verde; $16 per acre, cash. Address Joseph Zalkovsky, Palo Verde, Cal.

DAIRY SUPPLIES.

Have You a Cow?—Have you a creamery? Have you a cheese factory? Write us. Everything used in either a dairy, creamery, cheese factory, or for handling milk, cream, butter, or cheese. We are in a position to quote you prices on entire creamery or cheese-making outfits. We make a specialty of only the latest and best sanitary machinery and supplies. Send us a list of what you want and we will quote prices which we feel certain will interest you. O. J. Weber Co., 225-227 East Sixth St., Los Angeles, Cal.

MACHINERY.

ATTENTION, FARMERS!

120 Horsepower Pumping, Lighting and Power Plant, composed of two 60-horse gasoline or distillate engines, with Westinghouse generators, switchboard, circuit-breakers, storage batteries, etc.

In addition we can furnish four 20-H. P. D. C., one 10-H. P. D. C. and two 7½-H. P. D. C. Western Electric motors. All of these are in first-class condition, having been overhauled at our works.

Just the power for pumping several wells at a short distance from each other. We will sell one unit of 60 H. P.

This plant cost new $10,000, but we will sell complete for $4,000. The generators alone cost $2000. We can supply any extras as we have all the patterns of the parts. Will make prices on motors in proportion to the above.

Also one R. & V. 6-H. P. vertical gas engine, new, and one new 18-inch single-acting Addison pump head and cylinders. Price $360.00, which is 25 per cent discount on lowest purchasing price.

Do not miss this chance.

Axelson Machine Co., Wyse and Ann Sts., Los Angeles, Cal.

For Sale—32 H. P. Fairbanks-Morse distillate engine. Need money by the 1st, so will sell cheap for cash. Engine is in first-class order. Bailie & Brandt Co., 943-945 N. Main St., Los Angeles, Cal.

For Sale—9 H. P. portable distillate engine, heavy running gear. Will guarantee and make right price. Machinery Exchange, Main and Bruno Sts., Los Angeles, Cal.

For Sale—A good portable drilling rig, good for 800 ft., complete string of tools. About half its value, at $750.00. Address M. H. Magie, 1242 Harvard Blvd., Los Angeles, Cal.

For Sale—A practically new No. 2 Sharples Separator. Snap. C. P. Dandy, 421 Wilcox Bldg., Los Angeles.

DOGS

For Sale—Two beautiful pure Spitz male pups, very small breed, $10 each. Pure Buff Leghorn eggs. Mrs. Geo. H. Andrews. San Luis Obispo, Cal.

MACHINERY.

For Sale—Windmills, pumps, engines, piping, brass cylinders, guaranteed 1st class. Wagons, buggies, harness, plows, scrapers, power feed cutter, fruit crusher, 2 H. P. Hurst orchard sprayer, windlass, 20 H. P. hoist, sundries too numerous to mention.

8 ft. Aermotor windmill complete with tank and pump at $59 on cars.

2 H. P. engine, jack, pump and pipe complete, $89 on cars.

5 H. P. Pumping Plant.

Special Sale—last chance—must move next week, 5 H. P. Stearns engine and jack, 5-inch pump, belting, engine house, 6000 tank and 24-ft. stand, $235. This is complete plant and running now, engine alone cost $225 new. Don't write in two weeks from now and expect a snap like this. Bring an engineer and examine it.

Tanks.

50,000 gal. tank and stand, 10,000 gal. tank and 34 ft. stand, fine cover $90, only used one year, 2,000 gal. $19.50, and many other sizes.

5-ton brand new parts for mowers and rakes, such as knives, guards, sickle guards, connection rods, 100 complete sets rake teeth. Will sell at 50 per cent off wholesale price. For real bargains and good material see Demmitt Co., upstairs, 120 N Main St., Los Angeles.

Business

RARE PLANTS.

A nursery or rather botanical garden which is a factor in the introduction of some of the choicest of plants is the Coolidge Fernery and Rare Plant Garden, the property of D. W. Coolidge of Pasadena. A tract on Colorado street in that city is given up to a botanical collection including among fruits several new citrus fruits, the white orange of Blida, a green orange from the King's Garden, Burma, a variegated orange, the Rangoon lime, in color and shape like the Tangerine, Avocado, Feijoa, Sapota, Cherimoya, Macadamia or Queensland nut, Kai apple, Carissa or Natal plum, Harpephyllum of Caffir plum, Castanospermum or Moreton Bay chestnut, Rose apple, and other uncommon fruits; many rare ornamentals, a Japanese arbor covered with rare vines in which will be displayed many Japanese lilies and plants, a lily pond showing many rare Nympheas, an acre devoted to bamboos (over 25 varieties), an acre of roses, many of the French and German roses with all of the best Americans, and over 100 varieties of evergreen ferns.

GOODYEAR TIRES LEAD.

More cars were equipped with Goodyear tires than any other kind among the exhibits in the automobile show at Grand Central Palace, New York. The tire census taken among the exhibits showed a total of thirty-two cars out of the 119 exhibited fitted with Goodyear tires. The Goodyear had a good lead on its nearest rival, which was represented on nineteen machines.

The premier showing of the Goodyear tires gives an idea of the standing of that tire in the eyes of the manufacturers of standard motor cars. The exhibitors all want their cars to make the best possible showing at the show, and for that reason they are always equipped with the tires that the manufacturer feels are **the best.**

The unsolicited testimonial to the Goodyear places it in the proud position of being considered the best tire made by a large number of the manufacturers of standard motor cars.

Fertile eggs for hatching. Choice varieties. White Rocks, White Wyandottes and White Orpingtons at $1.50 to $4.00 per setting; $6.50 to $10.00 a hundred. Ducks —White Muscovy, Dark Muscovy, White Indian Runner, White Pekin, Buff and White Orpington, $1.00 to $3.00 a setting; $5.00 to $12.00 per hundred. Send for Circular. Pheasants' eggs in season.

WICK'S WHITE FOWL FARM, Moorpark, Cal

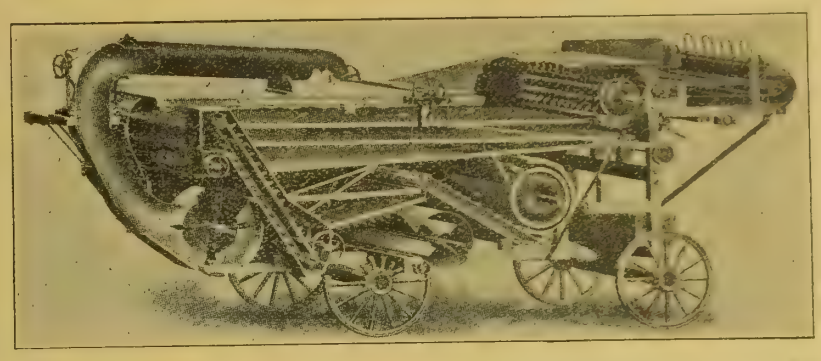
Music WRITING THOROUGHLY taught in 15 easy lessons. No knowledge of music necessary. Success guaranteed. Valuable book —"How To Write Music,"—sent free. Desk 51, Nat'l Conservatory of Musical Composition, Washington, D. C.

Compare

In order to be convinced that the **BIRDSELL** principle of hulling (rubbing it out) is correct, you will only have to compare a head of Wheat with Alfalfa.

You can readily see that the leaves, the seed, the seed receptacles, in fact they differ so widely that a blow which will thresh out grain will not be sufficient in threshing alfalfa, because it must be rubbed out and the **BIRDSELL** is the machine to do it.

Compare



this machine with the ordinary grain separator and you will agree with us that the **BIRDSELL** is the only machine made that will save all the seed and put it in the sack ready for market. We can sell you a combination machine if you want one. Get busy now, write or come in and see us, we will put our time against yours.

Tap the Air for Nitrates and Cut Your Fertilizer Bill in Half

High Bred Nitrogen Gathering Bacteria put on the Seed will do all the Work

DON'T pay big prices for nitrate fertilizers. Don't waste the time and labor needed to spread them. Let nitrogen-gathering bacteria do the work for you at a mere fraction of the cost and practically **no extra work.**

Here is the making of all the nitrates you want at a cost of $2.00 an acre.

This Bottle does the work for an Acre.

FARMOGERM

High-Bred Nitrogen-Gathering Bacteria.

Farmogerm is a pure culture of nitrogen-gathering bacteria that have been carefully selected and bred up to a state of strong vitality and great nitrogen-fixing power. That is our guaranty. Farmogerm is a jelly-like culture, put up in specially sealed bottles, guaranteed to reach you in perfect condition and to keep for months.

It is Ready to Use on Your Seeds

Just mix with water and moisten the seed or spray on soil or young plants. The bacteria will increase rapidly, by the millions, in the soil, and draw nitrogen from the unlimited supply in the air, feeding it to the growing crop and storing it in the soil for future crops. For use on Alfalfa, Clover, Peas, Beans, and all legumes.

Get Our Free Book AB and reports from high authorities and many farmers who have tried it and **know.** We can prove every claim. The U. S. Dept. of Agriculture states that the pure culture method of soil inoculation has "come to stay." **Order Now** if you want to plant at once, or spray on what you have planted. **Acre size $2.00—Garden size, for Peas, Beans and Sweet Peas, in mixed culture, 50c.** White Clover also in 50c.-size. Mention what crop you want it for when ordering. We pay postage or express charges to you.

Home-made Gas-Light From Crushed Stone

TWENTY years ago the oil lamp had already been driven out of the city into the country home where gas could not follow—so we thought.

In those days we would have laughed at the idea of a country home lighted with gaslight.

But like the telephone and free mail delivery gaslight has finally left the city to become a common rural convenience.

In the year 1911, the up-to-date villager or farmer not only lives in a gas-lighted house, same as his city cousin, but when he drives home on a cold, wet night he actually lights up his barn, his barnyard or porches on his house with this gas-light by simply turning an "ignition" button on a post or wall.

CRUSHED STONE

* * *

And this change seems quite like magic when you consider that this rural gaslight is home-made— made by the family itself right on the premises.

Take fifteen minutes once a month to make all that can be used in a large house.

The magic is all in the curious manufactured stone known commercially as "Union Carbide."

This wonderful gas producing substance, "Union Carbide," looks and feels just like crushed granite. For country home use it is packed and shipped from warehouses located all over the United States in sheet steel cans containing 100 pounds.

Union Carbide won't burn, can't explode, and will keep in the original package for years in any climate. For this reason it is safer to handle and store about the premises than coal.

* * *

All that is necessary to make "Union Carbide" give up its gas is to mix it with plain water—the gas, which is then instantly generated, is genuine Acetylene.

When piped to handsome brass chandeliers and fixtures Acetylene burns with an intensely brilliant, stiff flame, that the wind can't affect.

This flame makes light so white in color that it is commonly called "Artificial Sunlight."

Experiments conducted by Cornell University have proven that it will grow plants the same as sunlight itself.

Physicians recommend Acetylene as a germicide and a remedy for eyestrain, and it is used as an illuminant in fifty-four hospitals in New York City alone.

Then, too, Acetylene is so pure that you might blow out the light and sleep all night in a room with the burner open without any injurious effects whatever.

On account of its being burned in permanent brass fixtures attached to walls and ceilings, Acetylene is much safer than smoky, smelly oil lamps, which can easily be tipped over.

For this reason the Engineers of the National Board of Insurance Underwriters called Acetylene safer than any illuminant it commonly displaces.

In addition to all these advantages, Acetylene light is inexpensive.

An Acetylene light of 24-candle power costs only about 4 cents for ten hours' lighting, while for the same number of hours regular oil lamps of equal volume cost about 6 cents in kerosene, chimneys and wicks on the average.

* * *

Consider this carefully and you will hardly wonder at the fact that there are today no less than 185,000 town and country homes lighted with home-made Acetylene, made from "Union Carbide."

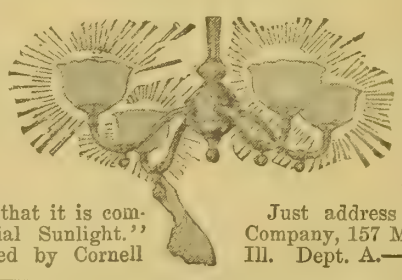
Once a month some member of the family must dump a few pounds of Union Carbide in a small tank-like machine, which usually sets in one corner of the basement.

This little tank-like machine is automatic—it does all the work—it makes no gas until the burners are lighted and stops making gas when the burners are shut off.

The lights located in every room in your house, on your porches, in your horse and cow barns, or barnyards and chicken yards if you like, will all be ready to turn on with a twist of the wrist or a touch of the button at any time of the day or night.

No city home can be as brilliantly or as beautifully illuminated as any one of these 185,000 homes now using Acetylene.

* * *



If you want to be up-to-date, enjoy modern conveniences, and keep the young folks at home, write us how many rooms and buildings you have. We will send you free an intensely interesting lot of facts, figures and booklets.

General Household Notes

A WOMAN'S ALPHABET.

I will be:
Amiable always.
Beautiful as possible.
Charitable to everybody.
Dutiful to myself.
Earnest in the right things.
Friendly in disposition.
Generous to all need.
Hopeful in spite of everything.
Intelligent, but not pedantic.
Joyful as a bird.
Kind even in thought.
Longsuffering with the stupid.
Merry for the sake of others.
Necessary to a few.
Optimistic, though the skies fall.
Prudent in my pleasures.
Quixotic, rather than hard.
Ready to own up.
Self-respecting to the right limit.
True to my best.
Unselfish, short of martyrdom.
Valiant for the absent.
Willing to believe the best.
Xmplary in conduct.
Young and fresh in heart.
Zealous to make the best of life.
—Ex.

THE STORY OF BLUEBEARD.

"O, sister Anne, go up, go up, and look
out of the tower;
I'm dead unless my brothers come in
a quarter of an hour."

How many children have been half frightened and wholly interested as they have read or heard the story of Bluebeard? In Brittany, France, where the story probably originated, fathers and mothers and nurses repeat the narrative of this wicked man, sometimes telling how he murdered his many wives, at other times how he cruelly destroyed boys and girls.

One popular account is that Bluebeard was a man of great power and wealth, who married a beautiful young lady. Some time after their marriage the husband said he was going on a journey. But before starting he gave to his young wife the keys to all the rooms in his palace, and with the rest a little key to a private chamber. She was to have ready access to the rooms which the large keys unlocked, and make use of their treasures as she wished; but the private chamber she was forbidden to enter.

After Bluebeard's departure, for some days his wife obeyed his command, but at last she became so desirous of looking into the forbidden room that she took the little key, unlocked the door, and peered in. What did she see? Ranged around the walls of the room she beheld the murdered bodies of his six wives. This so excited the young woman that she dropped the little key, and it became stained with blood. Hastily she picked up the key, and tried to rub off the dark and telltale spots. But this she was unable to do.

Soon Bluebeard returned home, and asked his wife for the keys. When she gave them to him he saw the blood stains on the small key, and accused her of going into the forbidden chamber. He became very angry. "You have been in the closet once, and you shall go again," he said. This filled the young wife with fear and trembling, and she fell at his feet asking for mercy. But the hard-hearted man would only grant her a reprieve of fifteen minutes.

The bride had a sister in the castle, and two brothers who she knew were coming to visit her. Almost in despair she shouted to Anne, her sister, to run to the top of the house, look over the country to see whether her brothers were coming, and if so, to shout to them to hurry to her deliverance. At first Anne saw no horsemen, but when she looked the next time she beheld two riders coming very fast. They proved to be the brothers, and they reached the castle just in time to rescue their sister, and to put to death the cruel-hearted slayer of wives.

The other account which the cronies of Brittany tell to their wondering hearers is how Bluebeard killed boys and girls, and used their blood to try to discover the elixir of life, which would restore old age to the beauty, strength and vigor of youth.

While both of these stories are somewhat mythical in character, the latter at least has a basis in fact.

Some years ago Thomas Wilson, LL.D., was appointed United States consul to the city of Nantes, France. While there he made a thorough study of the life of Gilles de Retz (or Rais), a soldier of Brittany, who lived in the fifteenth century. Many of the historians and literati of France believe this man to have been the original Bluebeard. His life is of thrilling interest, and whether or not he is the Bluebeard of children's folklore, it is true that his debased and cruel character and his abominable acts make him worthy of posing as a bloody-handed villain.

Gilles de Retz was born in the chateau of Machecoul, Brittany, France, in the year 1404, it is supposed. When he grew to man's estate he became a soldier, noted for bravery and daring. He fought in the war against England with Joan of Arc, and so distinguished himself as to become a marshal of France. He was of noble birth, rich, lord of many manors, and respected both by the nobility and peasantry of his country.

In person he was tall, handsome, well-formed. His complexion was fair, eyes large and blue, eyebrows and lashes long and black. Long black hair covered a nobly formed head, and his full, silky beard, raven black, becoming shiny, had an appearance of blueblack. This may have given him the name Bluebeard.

After the wars in which he fought Bluebeard returned to his estates and lived in splendid luxury. His extravagant style of living made great inroads upon his wealth, and at last some relatives who expected to inherit a part of this property made complaint to the authorities.

It was at this time that Gilles de Retz determined to recoup his fortunes by resorting to "ways that are dark," namely, black art, magic, and other secret processes. His ambition was to find the philosopher's stone, which would transmute base metal into gold, and to discover the elixir of life, which would restore youth to old age. We shall see how his methods brought terror and consternation to many hearts.

In the year 1432 a large district in France became excited by the frequent disappearance of children. A child would be sent on an errand, or playing in the street, or visiting a playmate, and would mysteriously disappear. In spite of all attempts to discover its whereabouts it was never found. At last a very panic seized the people. They were at their wits' end.

At last the abductions were traced to De Retz by the Bishop of Nantes. The crimes exposed form one of the most cruel and tragic chapters in French history.

It transpired that the murders were committed at the Chateau Tiffanges, a large and commodious stronghold. In this building Gilles de Retz and an Italian priest and alchemist, Francois Prelati, by name, fitted up a laboratory.

In this laboratory the two men by alchemy, magic, and murder attempted to discover the elixir of eternal youth, and to change inferior metals into gold.

Gilles de Retz was twice tried for these enormous crimes, first by the ecclesiastical and then by the civil court. He was found guilty by the church and excommunicated, but upon repentance this punishment was remitted. By the criminal court he was condemned to be hanged and his body burned.

To many there is little doubt that when Charles Perrault placed the story of Bluebeard in his book "Contes de Mere l'Oye." ("Tales of Mother Goose") in 1647, he had in mind Gilles de Retz as the original of Bluebeard. —Classmate.

Winter Rhubarb a Wealth Producer

Valuable Suggestions Secured from a Short Interview with J. B. Wagner, the Pasadena Plant Specialist and Grower of Giant Barb which Promises to be a Wealth Bringer.

For ten years Crimson Winter Rhubarb has been a favorite with a few California growers. Of course during the first few years it was known only to those who were quick enough to see the advantages to be derived from taking up a new thing of such great merit. One of the earliest to see possibilities in its production was Mr. J. B. Wagner, the plant breeder of Pasadena. Mr. Wagner determined to give a thorough trial to the plant, and while most enthusiastic from the start, did not realize the full advantage such an industry might be to this state until he had made a few seasons' practical tests. With all of his enthusiasm for the plant, he was not blinded to the fact that in some points there was need of improvement. The way to secure the improvement was not so plain as the need of it, but at the same time, the only way to improve is "to improve," and Mr. Wagner went at it with a will.

RHUBARB READY FOR SHIPMENT.

Size a Factor.

The one defect that he decided to overcome was in the matter of size. Crimson Winter flavor and Crimson Winter color, and in fact every other quality except the one of size, was to the queen's taste. It was necessary to reproduce plants, with the rapidity required, to reproduce from seed, and from some strains of the Crimson Winter, these seed did not always produce plants which gave as large stalks as the trade preferred. Here was Mr. Wagner's opportunity, and not satisfied with the foundation he had in the very best plants which could be procured from Mr. Burbank, he ransacked the world over for others which came as near to Crimson Winter qualities as possible, and at the same time were more desirable in size. The first season brought but little encouragement, the next little more, but persistence finally evolved "Wagner's Giant" which embodies all of Crimson Winter's highest qualities and has a stalk almost the size of a man's wrist and two or three feet in length.

Now for Sale.

As the Cultivator has announced before, this strain of rhubarb has not been offered to the public until this season. It has been tested out for several years on Mr. Wagner's Experimental Grounds, and has proven so satisfactory, and the trade has looked at it with such admiration that the plant breeder has decided to dispose of a few roots as a starter.

The size of this plant was illustrated in the issue of the Cultivator of January 27th, 1910, the photographs showing the stalks to be fully as large as Mr. Wagner's wrist. In length it runs from two feet to sometimes as high as three feet.

A Few Hints.

As this product is now to have a wider distribution, and as many will be inquiring as to manner of culture and requirements of the trade, we give a few hints along those lines.

Get hardy, stocky plants, growing only such plants as will produce desirable "fruit." (We say fruit, for this product is really in the fruit class, and every dealer should endeavor to put it up in such a way as to have the attractiveness of the most desirable deciduous fruits.) Grade carefully, because while the industry is in its infancy it should not be injured by putting on the market anything but the very best. One large concern shipping Crimson Winter rhubarb to the East has advised packing in bunches instead of loose in boxes as many have done in the past. Put in each bunch printed instructions for cooking, or have instructions on attractive lithographed wrappers.

Be sure to cut the leaf from the stem in such a way as to leave a small portion of the leaf. If a part of the stem is cut away with the leaf, it has been proved that the stalk will not hold up in long transit so well as if a very small portion of the leaf is left at the upper end. Also in "pulling," if the stalk is broken off at the butt end, that also will prevent long carrying. Gather while young and fresh. If too old and tough the plants are past their best and the trade will surely be injured. Do not wash before shipment. Water applied at time of gathering injures its keeping qualities. The same holds true as to gathering in the morning when very wet.

Above all, demand plants which are red; upon this very much depends. Be sure such plants are secured. Deal with a reliable propagator. One shipper says that even the size may be sacrificed rather than color. That is what Mr. Wagner worked so long to obtain with his "Giant," that is, he has demanded redness as well as size in his wonderful plant.

The Market.

Regarding the possibilities of California working up a great market for this product, one of the largest shippers has said: "It may take some little time to get a large and profitable market established but we believe success will be attained."

"MAKE ME A PIE, MAMMA."

A large dealer in rhubarb writes from Philadelphia: "We find that it is in favor in this city. During the past season it has consumed a car load per day. Where winter fruit is more abundant, the demand might be limited, but the Eastern market must be made, just as it was for oranges and other fruits. If this is done, the industry will become a permanent success."

When the great field for marketing rhubarb and the limited field for growing it are considered, it is no wonder that Mr. Wagner has persisted in his investigations until he has made most signal success. Later, when the state is shipping out train loads of rhubarb, it will give him the credit due for his persistent labors in breeding these desirable strains which will produce 52 weeks in the year whereas the common varieties cease bearing in 12 or 14 weeks.

If any puzzling problems confront the producer, they will be solved in a few words by this plant breeder who has investigated rhubarb in nearly every section of the state. Tear off the attached coupon and mail at once to J. B. Wagner the Rhubarb King of Pasadena. If one lives in Southern California, the trip to Pasadena will be well repaid. Take the North Loop car and go east on Orange Grove Avenue to the City Limits. Then go south to the school house where you will find Mr. Wagner's place where many kinds of rhubarb may be seen.

A letter to Mr. Wagner at his Pasadena home will bring you his 64-page treatise on Rhubarb, which contains much more information than can be given on this page.

Fill Out and Mail this Coupon NOW

Any one having good land can get credit for plants. No California product ever has or ever will pay as well as Crimson Winter Rhubarb. For full information and circulars, send this to **J. B. WAGNER, Pasadena, Cal.**

Citrus Fruit Market

LOS ANGELES, Feb. 22, 1911.

A material improvement is noted in the orange market. Prices are somewhat higher, but, more, the general tone is greatly strengthened. This is gratifying, especially in face of the exceedingly heavy shipments now being made. Exceptional days see the 200 mark reached, and the more ordinary days fall but slightly below it. Extra fancy navels easily command $2.50, and some markets have crowded them up close to the $3.00 mark. The decay which was so serious is not so pronounced, owing in part to weather conditions being more favorable and to extra care being given in packing house and orchard.

The lemon situation is much the same as it has been for several weeks; the shipments are not heavy, but such offerings as are made are readily picked up. In quality, Californias are a long favorite over Mediterraneans.

Shipments.

Shipments of oranges since November 1, 10,005 cars; of lemons, 1,381; total of citrus fruits, 11,386 cars. To same date last year: Oranges, 5,894; lemons, 1,203; total, 7,097.

NEW YORK, Friday, Feb. 17.—Twenty-three cars navels and three cars lemons sold. Market unchanged, both navels and lemons. Raining.

OBSERVATIONS OF THE YEAR.

(Continued from page 227)

secure the best available investigators, men adapted by training, experience and personal temperament, and set them to the work, to stay by it till demonstrated results are obtained, however long that may be, just as Mr. Powell was set to find the cause and prevention of fruit decay, and as Mr. Shammel has been put to his work.

Yes, this will take years and will cost—cost heavily. But what is the lack of this definite knowledge which is believed attainable, costing us now every year? Figure out what one-fourth and one-half of the entire expense of our present orchard fertilization amounts to, and somewhere between these sums, I believe, we will have the actual cost of the lack of the definite information needed, the cost of which would really be but a slight fraction of the amount we are throwing away every year. Yet we expect the industry is to be carried on by our children's children and then on.

CITRUS AUCTION.

The first citrus auction house on the Coast was opened at Los Angeles on Tuesday with the sale of ten cars at prices ranging from 90 cents to $1.50 per box. These prices were considered fair, but not up to the expectations of its friends. The second sale is being held today.

CHICAGO, Friday, Feb. 17.—Three cars navels sold. Market unchanged; strong on good, sound fruit. The following were sold by the Central Fruit Auction Company:

NAVELS—	Avge.
Orchard, Or, National O Co	2.65
Crafton, xf, Redlands G O A	2.09
Cloverleaf, Interstate F Dis	1.56
Standard, Sd, National	2.10
Black Beauty	1.49

Lemons rule easy. Some imported are now offered. This gives Californias some competition. At this season there is only a quiet trade. Boxes, California fancy 300s, $3.50; 360s, $3.25; off sizes, $3.00; extra fancy, $3.75; extra choice and choice, 25c per box discount; Messina, $2.00@2.50.

Oranges—The market does not change much either way. There remain good offerings of Californias. There is a good deal of soft, shrinkable fruit, and present mild, damp weather is not favorable. Buyers are not taking hold as freely as desired in view of the conditions. An easy feeling continues. Boxes, navels, California fancy 96s, $2.50; 126s, $2.50; smaller sizes outside in rather a small way, $1.75@2.25; choice and extra choice, 25c per box less.

Columbia county, Washington, yielded over 2,000,000 bushels of wheat last year. A big bunch of hops was sold in Spokane last week at 18½ cents; most growers are demanding 19 cents.

The ice plant at Coachella, Riverside county, has been acquired by the Holt interests of Imperial.

Cream Separators, all sizes and prices. O. J. Weber Co., 225-227-229-231 East Sixth street, Los Angeles.

The Big Weekly { Fifty-two issues, each containing from 24 to 32 pages of practical information, } For $1 the Year

California Cultivator

An Illustrated Weekly devoted to Horticulture and Agriculture

LOS ANGELES MARCH 2, 1911 SAN FRANCISCO

THE CHASE BLIGHT-PROOF WALNUT TREE.

THE LIFE HISTORY OF A GREAT WALNUT TREE.

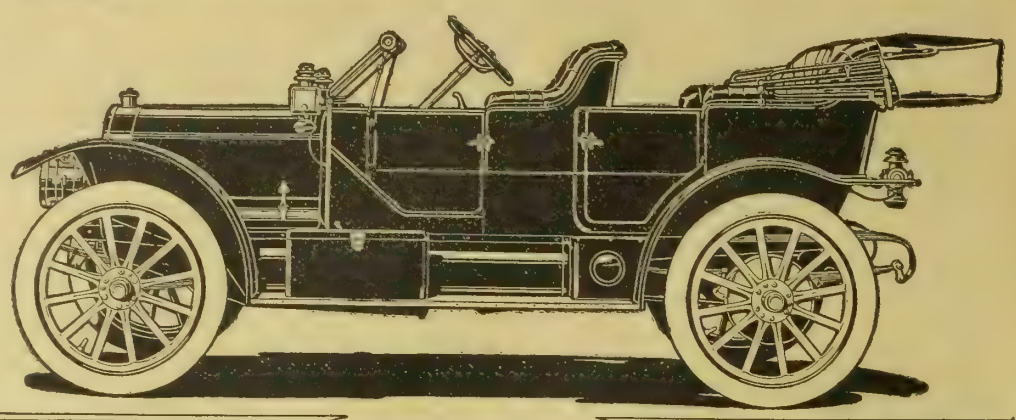
The Chase walnut tree was planted in 1886, about three miles south of Whittier, by Mr. Van Vorce. The nuts were obtained from France by the late Felix Gillett, the Baron Hill nurseryman of Nevada. This magnificent tree now has a spread of 80 feet and is the finest specimen of a walnut tree in California. It is noted for its size, vigor, bearing and blight-resistant characteristics. It bears a regular annual crop of nuts, the heaviest being 325 pounds. The nuts are large, well filled, and of fine flavor, and are smooth, thin shelled, well sealed and never perforated.

The bacterial disease, or blight, as it is sometimes called, is robbing the walnut grower of thousands of dollars annually, and will probably continue to do so the remainder of the life of all the seedling orchards now planted. This blight can be overcome only by immune varieties, of which the Chase stands among the first, and with all its other good qualities this places it in a class by itself.

A thorough test of the bearing and immune qualities of this tree can be seen in the 20-acre orchard lying just east of and adjoining the La Habra school house in Orange county, which contains trees planted from all Chase grafts excepting four rows, which are Chase seedlings. Here can be also seen the superiority of grafted trees over seedlings. This orchard has been pronounced by all who have seen it to be the heaviest bearing and most free from blight of any orchard of equal size in the state.

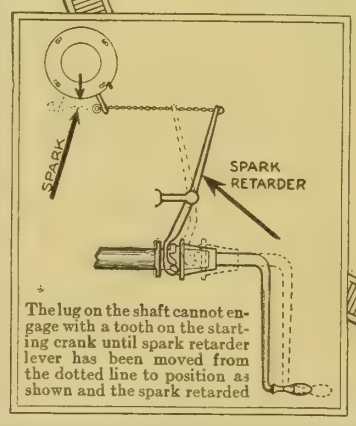
Mr. A. R. Rideout, Whittier, Cal., who is himself a recognized authority in practical horticulture, is so keenly alive to the importance of clean orchard trees, that he is at all times willing to show interested parties these blight-proof walnut groves, and cheerfully invites correspondence on the subject.

Rambler Motor Cars



Rambler
Sixty-three

THERE is no danger in cranking a Rambler. The Rambler Safety Cranking Device removes possibility of injury to you. Examine the illustration below and you will see how important is this exclusive Rambler feature. The Rambler has many such advantages of safety, comfort and convenience. Big wheels, big tires and long wheel-base make it ride easily. Seven-eighths elliptic springs and shock absorbers protect you from jolts. The steering pillar may be adjusted to suit your comfort. The upholstering is that found in the finest club furniture. The Spare Wheel removes worry about tire trouble and brakes are larger than will ever be needed. The Offset Crank Shaft and Straight Line Drive enable slow driving on high gear in crowded traffic and obviate the necessity of rushing the hard pulls through sand and up grades.



The lug on the shaft cannot engage with a tooth on the starting crank until spark retarder lever has been moved from the dotted line to position as shown and the spark retarded

A telephone message to the nearest Rambler representative will bring this car to your door for inspection. The new catalogue is ready. Send for it.

Brightest Men in the Industry Seek More Information

The Citrus Growers Generally Concede Themselves to be in the Class of Those Who Know Not and Know that They Know Not all they Wish To, and are Anxious for the One Who Knows He Knows to Come and Show Them.

INFLUENCE OF STOCK ON SCION.

Some of the later arrivals answering Mr. Blanchard's question were necessarily held over till this issue. We hope these and those given last week will spur orange growers to closer observation and to reporting any case where apparent influence of stock—or trunk in this case—has been observed. For those who may not have observed Mr. Blanchard's question we repeat it.

Nathan W. Blanchard, Santa Paula.

"I submit to you a question which is an interesting one in itself, and which I would be very glad to have light upon, namely: Will the character of oranges grown from wood produced by budding into lemon stock, which is itself a growth from budding into orange stock, be influenced by the lemon wood, say from two or three feet from the lemon stock between its own bud and the orange bud? Some years ago many lemon trees were budded over into oranges. These lemon trees were presumably grown on orange roots, so that some growers will doubtless be able to answer the above question. The early orange growers will remember that oranges grown on Chinese stock or roots were very coarse and could easily be recognized."

Q. A. Lobingier, Arlington.

My experience with the case in question hardly merits an opinion that would be of value. This question of influence of stock upon the fruit has been up for discussion for many years, but I agree with you that the general belief is that the stock has no influence upon the quality of the fruit. My experience has been more extended with the apple than with either orange or lemon, and I always thought the variations noticed in the apple could be traced to the source whence the scions came rather than any influence of the stock.

J. W. Mills, Marysville.

In answer to Mr. Blanchard's query, I believe that the orange will be influenced by the lemon stock to a considerable extent. I can only give my reason as theory, though numerous cases seem to indicate that such is the case, regardless of theory.

We know that pears grown on quince stock (the trees being dwarfed) are very much changed in appearance and texture; some varieties are improved by such dwarfage of the stock. Conversely, the coarse, rank growth of the Chinese lemon has a tendency to rush the growth of the orange grown on it, resulting in a coarse product. While this theory does not work with all rank growing stocks, neither does it work oppositely in the case of all varieties of dwarfed fruits. There may be cases where the Chinese lemon does not have this effect, but the tendency seems to be to grow a fruit in sympathy with the stalk. It has been proven beyond doubt that in many cases young orange trees budded on pomelo stock (also a rank grower) have become badly diseased even before they leave the nursery. Oranges budded on Chinese lemon are prone to contract gum disease also. These two stocks seem to have an influence on the bud, but the pomelo stock does not seem to influence the fruit. Experience seems to indicate that the Chinese lemon does, which, after all, is worth more than all the theories.

W. P. Watts, Covina.

I have about 600 trees that were grown as lemon trees for eight years. They were budded to Valencias nine years ago and are bearing fine crops of fruit none the worse for the lemon stumps. I think that to insure success the trees should be budded early and leave lots of wood to carry the sap, and when the buds start leave a sprout on the opposite side of the limb to keep the limb green. By this method I should hope to avoid mottled leaf that affects budding trees.

Dr. F. Franceschi, Santa Barbara.

Please excuse delay in replying to your letter. I tried to gather more information which might throw some light upon the most interesting question proposed by Mr. Blanchard, but I regret to say, with very meager result.

I remember quite well that in 1892, when I first came to Santa Barbara, people had started to bud orange orchards to lemons, but I was unable to ascertain, and very much doubt, that any of said trees did escape the "grubbing out" which took place eight or ten years later in Montecito and elsewhere.

The only personal experience which I have had in this line was when, some ten years ago, I had raised a number of "Florida rough lemon" and Citrus Trifoliata seedlings, and had them budded to different varieties of citrus fruits. Contrary to my expectations, I could not detect any difference in growth of the two different stocks. Those trees were sold and scattered about, and I have entirely lost track of them.

Mr. Kahles of the Crocker ranch, our best authority on lemon growing, does not believe that the character of orange fruits can be influenced by the quality of stock they are budded upon.

G. P. Rixford, San Francisco.

Undoubtedly the orange will be influenced by the two or three feet of lemon wood between it and the orange root, the same as if budded into a lemon stock on its own root. The effect of stock on the graft is not clearly understood, but is generally considered by horticulturists chiefly a dwarfing or an invigorating effect. The well-known dwarfing of the pear on the quince and the apple on Paradise stock are instances of the first, and the English walnut on the California black is a good illustration of the latter. I doubt if the flavor of the fruit or its general appearance is affected by the character of the stock, though there is quite a widespread opinion among citrus cultivators that the China lemon stock produces a coarse, rough orange.

In this connection it would be interesting if some of our cytologists would investigate the cellular tissues at the point of junction of stock and graft of different varieties of trees. The cells of the quince elaborate the sap, and quince fruit is evolved. When a pear graft is inserted on the quince, through the functions of the cells of the graft, a pear is produced. There are doubtless differences in the cellular tissues of the two woods, or in their cellular functions, that account for the result. Microscopic study of the point of transition of one set of cells into the other would be interesting, and might explain the phenomena.

W. H. Volck, Watsonville.

With regard to the question of Mr. Nathan W. Blanchard I have no expermental data bearing on this subject, but would infer that the small amount of lemon wood forming the trunk would have little or no influence on the orange fruit. There has been quite a little of this kind of working over done in the citrus groves, and I have never heard of any effect on the fruit.

Burle J. Jones, Phoenix, Ariz.

In debating the matter I have in mind a record I once saw in a horticultural journal in which some enterprising grower in Florida had been experimenting on this very thing. He had selected from his grove a number of buds from his choicest Navels. A portion of these he inserted into the tops of Navel trees that were not as good as those especially selected and still others he put directly into old sour, or bitter, Seville trees. The flavor and general texture of the fruit resulting from the former was reported by him as being in no respect finer, smoother, or better than that taken directly from the sour orange stocks, though in general he acquired a much better fruit by this process of budding over than he had previously secured. From this it appears that the fruit is likely to follow the bud and not the root stock. From my own experience and observation, however, I can imagine that there might be a limit to this. It has, of course, been argued in California for some years that the fruit from a grove budded into sweet root is sweeter and perhaps a little finer in texture than that on sour. As the study of this matter progresses, however, it appears that there is little ground for this assumption and that the difference generally lies rather in the methods by which the groves are handled. I have never seen any instance where the quality of the fruit, citrus fruit, was known to be materially influenced by the sweetness, acidity or coarseness of the natural fruit of the root to which it was budded, but I should feel it necessary to make a very extended study of the matter before putting that down as a definite conclusion.

In the case cited in your letter I am reasonably certain that the intervening lemon wood will not affect the quality of the fruit and that it would pay far better to select the orange buds to be inserted with great care as to quality and bearing propensities than to endeavor to eliminate the lemon wood into which they are to be put.

FARMERS CLUB.

Next to a good farm paper, the Farmers Club and the Grange or other organization in which social and intellectual life are stimulated, possess greatest value. We believe we are justified in putting the good farm paper first, but there are some clubs in this state which are doing remarkably effective work. It was our pleasure to attend a meeting of one of these clubs a few days ago at Covina. The interest shown and the questions discussed were certainly a credit to the fruit growers of that section. The club meets monthly at the Woman's Club House, the attendance having become so large that private residences are unable to accommodate it.

The afternoon is spent in discussion of vital topics, one of the principal ones at the recent session being chlorosis of the orange tree. On this point the club has heard men of scientific attainment. Other lighter topics, together with an excellent musical program, filled out the afternoon. Later the ladies took charge and refreshments were served. A novel rule obtains that the ladies assigned to each afternoon's entertainment are restricted to three articles on the menu. On this afternoon, however, they fudged, and cake was slipped on the unsuspecting attendants in addition to the coffee, sandwiches and salad.

The benefits of such a club are not only in the social pleasures of the afternoon, but in the bringing together in one aim of those who are following the same calling. Questions pertaining to the welfare of the community are discussed, and if not solved, a better understanding of them is gained. There are several of these clubs in Southern California and many Granges in the northern part of the state. It makes little difference what is the name or particular plan of the organization so the people get together. The movement should be extended.

Fumigation of San Bernardino county orchards under private contracts is not proving so satisfactory as under the former county control plan.

LARGEST CITRUS NURSERIES IN THE WORLD

Parties contemplating the planting of citrus groves this coming spring will do well to send for our prices soon, as there will evidently be a shortage of strictly first class stock. Write today for particulars, or, better still, pay us a visit so that we may be able to show you just what we have.

Our finely illustrated booklet, "Citrus Fruits," covering the industry from the seed to the market, mailed to any address on receipt of 25c in stamps.

Citrus and Tropical Fruits

ORANGE SEED BED.

Answering request of a subscriber for information as to handling orange seed bed we quote from Citrus Fruits by R. M. Teaque of the San Dimas nurseries:

Preserving the Seed.

To insure good results the seed should not be allowed to become dry after being taken from the fruit, but should be heeled in moist sand in a cool place or kept in water, changing the water frequently to avoid having the seed sour. It can be kept for a considerable length of time by either of these methods. Great care must be taken in handling the seed so as not to bruise it to any extent.

Planting the Seed.

The best season in the year for planting orange seed is in the early spring months, much depending on the season; preferably from March to May. If the soil is cold the seed is apt to decay in the ground before germinating. It is much better to wait until the warm weather has commenced. The ground should be kept moist after the seed is planted so as to insure its germinating properly.

Preparing the Seed Bed.

In preparing the seed-bed for the seed, the ground should be well plowed or forked up to a depth of at least twelve inches, leaving the soil as loose as possible. After preparing the land in this manner, it is necessary to erect a lath house of sufficient size to cover the ground to be used for a bed, or to cover same over with burlap or light cloth of some kind. In erecting the lath house, it is best to use common plaster laths, nailing them on 1x3 battens with space left between each two the width of the lath. In this manner the ground is half shaded, which is sufficient for the protection of the plants after they begin to grow. If it is undesirable to go to the expense of a lath house, the bed can be successfully covered at much less expense by putting up stakes at intervals and stretching wires on them. In these wires should be strung strips of burlap or light cloth. This protects the young plants from the sun.

There are two methods of sowing the seed, the first being by broad-casting. After the seed is scattered, it should be covered to a depth of about one inch with sand which has been thoroughly screened before using. It is also a good plan to first cover the seed with about its own thickness of fine sifted soil before applying the sand. This will insure the seed being moist at all times and will greatly help in the germinating process. In following the above method of planting it is necessary to sow the seed in beds, leaving small walks of sufficient width so a man can go through to spray properly when necessary with a garden hose, and without damage to the plants. The second method of sowing the seed is in drills of from eight to twelve inches wide, leaving about a six to eight inch space between each drill for the running of water in irrigating. Seed sown in this manner will grow stockier plants as a rule than by the broad-cast method in beds. However, it takes up more room for a bed of an equal number of plants than by the broad-cast method. After the seed is planted it is necessary to keep it sufficiently watered for the germinating and starting of the plants, but not an excessive amount of water. If too much water is used, it is apt to decay the seed in the ground.

If the bed has been properly cared for and the season favorable, the plants should be ready for removing to the nursery the following season, or one year from the time the seed is planted, though if desirable they can be carried two years in the bed before being removed, and with good success. In this way a much larger lot of plants would be secured. It is not best to plant very small seed-bed stock in nursery form, it being too delicate to successfully withstand the open rays of the sun and is apt not to start readily in the nursery, if at all. Where the removing of the plants from seed-bed to nursery can be delayed, it is best to leave them two years, as the stocks vary in size. If desirable, the larger plants can be removed from the bed the first year from the seed, and the small ones left in the bed another season. As the remainder will then be thinned to some extent, the plants remaining in the bed will do much better and make good, stocky plants at the end of the second year.

Transplanting to Nursery.

In taking up the seed-bed plants for nursery planting, it is well to thoroughly wet down the bed so as to insure getting all the root system possible, and in loosening the plants it is best to use a four-tine spading fork. After they are thoroughly loosened they can be taken up and made or sorted in two grades, or the larger ones can be pulled out, leaving the smaller ones to remain in the bed over another season. If the entire bed is to be used at one planting, it is best to make two grades and plant in nursery form separately. In this manner, the small plants can be given extra attention and budded to some strong-growing sort to make up for the deficiency in size at the start. It is very necessary in removing the plants from the bed not to allow them to become exposed to the wind or sun, hence as soon as sorted pack immediately in damp moss and box securely until ready for the nursery. It is also a good plan to cut the ends of the tap roots off slightly so they will not double up at the botom when planted and cause the tap root to become crooked. A good method to follow is to take from twenty-five to fifty plants at a time, and by using a sharp tool of some kind, the roots can all be cut off at one stroke. It is also essential to cut the tops back in proportion to the roots. The quickest and best method is to take a pair of hedge shears and trim up the bed to suit before removing. After the plants are topped and forked up and packed, they are ready for the nursery.

Preparing Nursery Ground.

The nursery ground should be thoroughly plowed and left as smooth as possible with a drag of some description to answer the purpose. After the ground is prepared to suit, it should be laid off in rows, which can be done as follows: stretch a wire the full distance of the field where the nursery is wanted, the ground having previously been staked off in rows the desired distance apart, and over the

wire run some kind of an implement to mark off the distance apart the plants are to be set. An implement of this kind can be made by taking a wheel and nailing or bolting on to it at intervals the distance apart the plants are to be set small cross pieces of wood or iron. This, when run over the wire, will make impressions in the ground where each plant is to be set. The ground should be moist enough so as to open properly when using a sharp tool or dibble for the purpose of placing the roots of each plant in the soil. After the marker has been run over the wire, it can then be taken up and moved to the next row or stakes where the row is to be, and thus be out of the way of the workmen in planting the one previously marked. The usual distance apart for setting the plants is from twelve to eighteen inches, with the rows four feet apart. It is best to have the rows four feet or more apart so as to allow ample room for cultivation without breaking off any of the young buds, and also room for a small sled to be run between the rows in taking the trees to the ends of the rows when ready for market. Planting too close together in the rows, is apt to make the trees inferior in size, and if it is intended to ball stock planted in this manner, it is not possible to cut out as large a ball of earth with the root system as it would be if planted further apart.

LEMONS.

By C. D. Hubbard, San Fernando.

A few don'ts in the lemon business.

Don't buy land to plant lemons on unless you are sure it is the right kind of soil. Don't buy land to plant to lemons where it is subject to frost.

Don't buy lemon trees unless you know they were budded with buds cut from the very best selected trees. Like produces like and years of labor and expense may pan out a failure just from the careless selection of buds. Don't plant a tree that has been stunted.

Don't fail to prepare your ground for planting lemon trees in the best possible shape. Level if possible to irrigate two ways. Don't fail to plow deep.

Don't fail to plant your lemon trees far enough apart. Don't fail to have a good large ball. Don't fail to cut the lemon trees back well when planting out. Don't dig too small a hole. Don't get too far ahead of your water when setting your lemon trees. Don't set the trees too deep. Don't fail to wrap the trunks with something as soon as set to protect from sunburning or getting hidebound.

Don't fail to give the trees plenty of water and as often as needed according to locality and weather. Don't let the suckers grow on the young trees. Don't fail to dig or hook up around the trees if water has run around them. Don't let the young trees go without staking and tying them so as to have them grow straight. Don't fail to put on some good stable manure and some good brand of commercial fertilizer right from the start. Don't let the gophers work on your trees. Don't let the branches grow down and lie on the ground; it will breed trouble. Don't fail to grow cover crops as long as you can. Don't fail to get all the straw and manure on you can. Don't fail to cultivate and plow deeply and thoroughly.

Don't put your pruning off too long. Don't haul out the prunings but cut

Deciduous Bush-Tree Fruits

THE LABORER IN THE VINEYARD.

By John T. Bramhall.

"The harvest truly is plenteous, but the laborers are few." That was an apt simile, indeed, in a country like our own, blessed by warm suns, an equable climate and a fruitful soil, and at the same time inhabited by a people who, for the very reason that their simple wants were easily supplied, were averse to manual labor. What are we to do in our fruitful California, where our ingenuity, and perhaps our cupidity, have called forth harvests beyond our capacity to reap? How shall we get laborers for the harvest?

It is, indeed, a singular problem, differing from that which confronts the husbandman in any other part of the country. The finest land, the finest climate, the most profitable crops—and yet a scarcity of labor.

In the days of empire-building, when our Pharaoh needed hewers of wood and drawers of water, not being able to get a sufficient number of Irishmen from the East, at the price, he turned to the West and got Chinamen. It was said to be a work of necessity. But be it noted that the Mormons built Salt Lake City without any aid from Chinese. As soon as it is perceived, as it must be, that our preservation and perpetuation as a white or Caucasian state and nation depends upon the exclusion of the Asiatic, means will be found for the introduction of desirable Europeans. And we need not look far for an example. Senator Dillingham, the chairman of the federal immigration commission, has made a detailed report on the subject of the immigration situation in Canada, from which much is to be learned that may be of great value to California in the work that lies before her. Anyone traveling in Canada, both in her cities and farming districts, cannot but notice the absence of that class of immigrants that we call "undesirable." Her working people, both in city and country, are of a high class of intelligence and ability, which may account, in some degree, for Canada's reaping more than twice as much wheat to the acre as we do.

The Canadian immigration policy, as we learn from Mr. Dillingham, is based on the purpose of the government to promote the settlement of the newly opened agricultural regions of the western provinces and other parts of the Dominion, and to discourage the coming to Canada of such classes of immigrants as tend to congregate in towns and cities. In other words, she uses a wise policy of selection, while we, with lavish prodigality, have wasted our substance in entertainment of each new-hatched, unfledged comrade. Canada looks to the United States, and our best agricultural states at that, and to the United Kingdom, and to northern and western Europe for her desirables, and carries on in those countries a systematic and successful propaganda to promote immigration to the Dominion. If an agricultural unrest is reported from Iowa, or from Finland, agents with descriptive literature—and it is honest literature—are sent to invite the farmers to come to Canada. The agents are paid a bonus of one pound ($4.86) for each man, and half that for youths, from Great Britain and northern Europe, and $3 per man, $2 per woman and $1 per child for immigrants from the United States. The difference is not based, it should be explained, upon the value of the immigrant, so much as the cost of the service. In 1908 Canada spent $480,000, in round numbers, upon immigration work at home (administration, printing, etc.), and $250,000 in the United States, $270,000 in the United Kingdom, and $74,000 in continental Europe. She got 58,445 immigrants from the United States (costing $4.30 each, not counting administration expense), 120,182 from the United Kingdom (costing $2.24 each), and 12,954 from continental Europe (costing $5.71 each). In addition to the above, she received, without making any direct expenditure, 54,600 immigrants from other European countries, including Syria, of whom 14,268 were from Austria north of the Carpathians, and 11,212 were from Italy and 6,280 from Russia, including Finland. The Oriental immigration numbered 12,108, but this proved so unwelcome that it was cut down to 2,388 in 1909.

On the whole, then, it would appear that Canada is getting a class of immigrants who, judging by race, language and religion, are likely to be quickly and advantageously assimilated with her population, 68 per cent of the total coming from the mother country and the United States. When we consider the occupation of the immigrants, we find that Canada has been equally fortunate. In an official pamphlet intended for circulation in the United Kingdom, farmers, farm laborers and female domestic servants are mentioned as the only persons advised to emigrate to Canada. And so we find that, of the total white immigrants in the past three years, 43 per cent were of the especially desired class, and 19 per cent were general laborers, mechanics and miners; 62 per cent workers. No wonder Canada is prosperous.

Why should not California follow the example of Canada? We may regard the states east of the Rockies as Canada does the United States, as good fishing grounds, and may send our agents to outbid those of the Lady of the Snows, or not, as we think wise. It is good hunting. There is scarcely a state that has not some settlements of Germans, Finns, Swedes, Norwegians, Belgians, Swiss, Italians (Piedmontese or Lombards preferred), Austrians, Hungarians, Poles—we may take our pick. Can anyone look closely at Texas, and see what the Germans have done for that state; or at Kansas, and note the benefits she has derived from the scorned Dukhobors; at Wisconsin and her Swedes; at the Italian colony in the Ozarks, and at the thrifty Polish gardeners in the Connecticut valley, without wishing that California had more examples of such wealth producers and home makers as these?

"But," says Mr. Bigranch, "you do not realize our real needs. These people are industrious, and honest, and all that, but they have a spirit of independence which ill fits them for laborers in the vineyard and orchard—in short, they lack the servile ability which——"

"Which would make them slaves, Mr. Bigranch, or peons. Would we not better recognize the fact that congress will not permit further open-

ing the doors to Asiatics, even though Japan is even now pounding at the gates and protesting against our proposed safeguarding our own lands? And would we not better realize that our only salvation rests in offering a friendly and cordial welcome to the intelligent and industrious white man, and giving him a white man's treatment when he comes?"

Should we wait for 1915, and a year or two after that? I think not. An immigration commission, entirely divorced from politics, under the direction, or perhaps selected by the State College of Agriculture and the Horticultural Commission, to look into the matter and study what is being done elsewhere, with power to take up the work at once, would no doubt bring good results. Our immigration work is all done at this end, when it should be done in the East. Let California send its agents to the East with the message: "A white welcome awaits the white settler in California."

EXPORTS INCREASING.

In your issue of Sunday, January 29, you quote from a long article on raisins in the Seattle Trade Register, most of the statistics in which were taken from the paper I read before the California State Fruit Growers Convention at Stockton on the 7th of December last. The article further states that in 1910 the exports amounted to 8,526,000 pounds, and that this amount had only once been exceeded, viz., in 1907, when the total was 9,128,000 pounds.

When I read this, I knew it was utterly wrong, but I believe in the old saying, that it is best not to prophecy unless you know, and at the time this was published the custom returns for the year had not been issued. Today I have received the advance proofs from Washington, and they show a wonderful and very encouraging increase in the export of California raisins, amounting to nearly double the quantity above quoted.

In order not to take up too much space, I will simply give you the figures, and allow them to speak for themselves.

Raisins exported during the calendar year ending December 31:

Year.	Pounds.
1905	3,978,645
1906	9,749,690
1907	4,720,606
1908	7,084,178
1909	8,363,845
1910	15,547,074

The imports of foreign raisins continue to show a considerable falling off, the figures being:

Year.	Pounds.
1905	11,511,347
1906	4,537,648
1907	9,927,771
1908	4,875,693
1909	5,219,649
1910	3,022,918

Thus, while the imports are the lowest on record, the exports are nearly double what they have ever been before.

The exports of most other fruits, also, show a very satisfactory increase:

Apricots (Dried).

Year.	Pounds.
1905	13,616,010
1906	3,268,457
1907	1,540,471
1908	14,463,948
1909	13,644,135
1910	18,366,055

Peaches (Dried).

Year.	Pounds.
1905	700,902
1906	1,819,863
1907	1,354,317
1908	1,296,095
1909	2,843,968
1910	4,946,406

Prunes (Dried).

Year.	Pounds.
1905	34,820,748
1906	31,777,704
1907	37,674,800
1908	18,087,319
1909	83,128,101
1910	64,470,370

Oranges.
(Quantity not stated until 1908.)

Year.	Boxes.
1908	714,365
1909	952,869
1910	962,229

The quantity of fruit exported depends to a certain extent on the size of the crop. For example, the prune crop for 1910 is estimated at about 74,000,000 pounds, compared with 150,000,000 the previous year, which was one of the largest on record. The apricot crop also varies greatly.

With another "Raisin Day," and a little more advertising of California raisins abroad, the consumption might be easily doubled, and the problem of how to get 3½ or 4 cents would then be solved.—George Robertson, in Fresno Republican.

THE CHERRY.

The cherry, it is true, likes good soil, but it is very impatient of much moisture. It must have good drainage to do well. The best of all soils—particularly for sweet cherries—is sandstone upland. In such situation it is no trouble to have abundance of the finest cherries in their season. There is no surer fruit crop when all is right; and every one who has a proper location should grow cherries. The fuit ripens so early and is so grateful to young and old, says National Stockman and Farmer.

How many farmers consider that a few cherry trees in bearing at home may prevent the children from committing depredations on their more thoughtful neighbors? Or, if it be said—which is true—that well-raised children do not do such things, it is also true that to be without this choice fruit while the neighbors are well supplied, is a trial to which no thoughtful parent would wish to subject his boys and girls.

And in obtaining young trees to plant, it is well to remember that the sweet cherries should always be budded (or grafted) on the Mazzard—their own kind. While the acid varieties are well suited with the Mahaleb as a stock, very few of the sweet cherries do well on it.

Shrinkage vs. Stability

MANY persons have found that their investments in stocks, bonds, real estate, etc., have shown large shrinkages in value during the past year. But there has been no shrinkage whatever in the value of a Savings Bank Deposit—either in principal or Interest.

Money deposited here earns at a fixed rate that you can thoroughly depend upon. And the income is clear, because money in Savings Banks is tax-exempt.

Consider these FACTS carefully. Remember, they apply equally to large sums or small—and that the Depositor of Ten Dollars receives the same consideration, courtesy and rate of interest as the Depositor of Ten Thousand.

Accounts opened at Four and Three Per Cent Interest—the latter with checking privileges under moderate restrictions.

¶ Perfect Safe Deposit Facilities. Boxes and Storage at Moderate Rates.

CALIMYRNA FIGS

The Best and surest Fruit to plant for large and certain Crops.

Year after year a fig orchard will yield abundantly, and the failure of a fig crop in California is an unknown quantity.

Living under your own vine and fig tree is one of the attractive similes of California horticultural life.

If your land is all planted to other fruits, put in a border of Calimyrna figs—which is the Smyrna fig of commerce, introduced by us.

In raising figs, the owner has only to care for them during the winter months and can generally sell the crop on the trees while still clothed in winter garb. Buyers pay from one to two dollars per tree for the future crop, and assume all responsibility for its maintenance and harvesting.

We have the largest stock on the Coast of MISSION OR CALIFORNIA BLACK FIGS, WHITE ADRIATIC, WHITE ENDICH, as well as CALIMYRNA.

TREES

All Varieties.

GERMAIN'S SEEDS ERMINATE

You can buy no better seed than that sold by us, and we are always glad to assist you in selection. Among other extra fine varieties that we recommend are the following

Three 1911 Specialties

CASAD'S Improved Muskmelon
A distinctly new sort that has been firmly established. Slightly netted rind, buff yellow flesh, luscious and smooth, approaching a pineapple flavor. Send for a packet 25 cents.

GIANT Stringless Green Pod Beans
This is a big favorite in the East and has proven a success here. It often produces pods six inches in length, tender and absolutely stringless. Very early. Packet 10 cents. Pound 35c postpaid.

GERMAIN'S Winter Queen Tomato
It is the earliest producer of all, and shows a wonderful resistance to frost. Compact bush, fruit smooth, even sized and finely colored, firm flesh. Packet 10 cents. Ounce 50 cents.

You should have our 1911 Catalogue—Please Mark Letter Dept. C

Garden and Field Crops

THIS MONTH.

By O. M. Morris.

In commencing this article it is necessary in making this of universal interest, that we divide the territory into, say, three sections. The first section, or that which is the earliest section or mildest in reference to cold, this section would be what we might term the immediate coast region, where there is no heavy frost. The second section we might term the Great Valley, and the third the Mountain section, at considerable altitude. Each is not wholly confined by these territorial divisions, as there are many exceptions even within a few miles of each other and one must be guided by his own experience or observations.

To this mildest section we will confine our operations; and for territory in section two, say, two weeks to thirty days later, and for the extremely cold sections thirty to forty days later than for the mildest section.

For the coast region nearly every variety of vegetable, excepting corn, melons and cucumbers, can be planted this month, and likewise hardy annuals, perennials and biennial flower seed; the more tender kinds can be protected for a few days in bad weather. We can now plant potatoes of early sorts. In some instances they may be nipped by frost, but are seldom damaged to any great extent. Plant liberally of peas, at earliest convenience so as to avoid the crop coming in very hot weather. These, in fact, can be planted now throughout the state. At this time the Yorkshire Hero is most popular in Southern California. It is yet a little early for beans, but some Canadian Wonders, Ventura Wonder Wax and Stringless Green Pods are being planted. These are all of the most hardy sorts. Beets are in order and can be planted now or at any time, in fact; Crosby's Early Egyptian for early short top, or Eclipse for a larger and taller sort.

Plant parsnips, onions, radishes, parsley, spinach, turnips, salsify, mustard, lettuce, endive, cress, chicory, etc. These are all hardy in most any section, where ground can be put into order. Also plant in beds for transplanting later the following: cabbage, cauliflower, onions, chives, collards, kale, brussels sprouts, asparagus, artichokes and leeks. The above are nearly all hardy and need no protection except in very cold regions. Make up your hot beds or protected frames and plant liberally of tomatoes, peppers and egg plants; the latter two should have some bottom heat to germinate well and a good hot bed is almost a necessity. A small planting of celery in the open is also in order for early supply, but it is too early for general crop.

Considerable planting is also being made of cucumbers and early summer squash in protected beds. The cucumbers are often planted directly in the ground and protected with cloth frames, but don't try this unless you are able to give them the required care, and also be sure of getting only the early forcing sorts, as the average seed will only bring disappointment. Early summer squash are often planted in pots or berry boxes, set in hot bed and when four to six inches high carefully transplanted to their permanent place during good weather, and covered cold nights. These early vegetables are the ones that bring the money.

Varieties of Vegetables.

There is a very remarkable difference in the varieties of vegetables used in different sections. In lettuce for example in the northern part of the state the market is satisfied (to some extent at least) with a loose heading variety, but the Los Angeles market demands a hard head suitable for shipping and with good keeping qualities and it must be of curled leaf type. In some other sections a smooth leaf variety takes preference.

The loose and smooth headed varieties are seldom used for shipping. The most popular on Los Angeles market this year is New York (special market gardeners strain), closely followed by Wonderful, which is also very popular; April and on until September the Iceberg will be the most popular summer variety. All these are hard headed, curled leaf varieties.

In cabbage, the Early Winningstadt is the most popular small early shipping sort, but the Cannon Ball, Danish Ball Head and Early Flat Dutch are the best market sorts, especially the first named, as it makes a fine showy head, of popular weight without the coarse ribs of the Dutch Cabbage, and is ten days to two weeks earlier than Winningstadt or any variety on the market. It is a new variety and not very generally catalogued by the seedsmen.

The most popular carrot is the Oxheart, an early fine sweet sort, closely followed by Danvers and Chanteney.

As many readers will be interested in early poultry greens, the China cabbage is highly recommended. It matures quickly and is gone before Swiss chard and kale are ready; it is also a good table vegetable, but it never forms a hard head like our cabbage.

In radishes, 25 to 30-day sorts, the Early Scarlet Globe and Early Scarlet Turnip are very popular, but it is not too late to plant the large Winter Japanese Mikado radish, which makes large fine roots which are very sweet without any tendency to pungency; also try some Japanese Summer radishes and California White Winter. These are all slow to bulb out and require considerable space for best development.

In Swiss chard the Improved Lyon has the largest leaf stalk, but any of the several varieties are good. For spinach the Winter Prickly seeded is best for the present time.

Home Grounds Beautiful

THIS MONTH.

By O. M. Morris.

The planting of all hardy annuals is now in order. Asters, poppies, larkspur, centaurea, gypsophila, nasturtiums, sweet peas, phlox and all like plants are seldom if ever hurt by cold spring, and should be planted as early as possible. Also the biennials, such as Canterbury Bells, Sweet Williams, etc., should be planted as well as all the list of hardy perennials. If planted early the most of the perennials bloom the first year and make strong plants for the succeeding year. Such as delphiniums, hunnemanias, salvias, verbenas, anemones, coreopsis, etc., bloom in about four months if planted now.

ORNAMENTALS.

From a paper read before the Tulare Grange by Thos. Jacob we take the following suggestions as to ornamentals suitable for the San Joaquin Valley.

In this county the subject would seem to be one of locality more than climate, for while the same general climatic conditions prevail in all the lower portion of the county, the nature of the soil, natural or applied moisture and comparative freedom from frost all go to make local conditions that have a bearing on this question. With proper care almost any tree or shrub of the temperate or semi-tropic zone will flourish here.

Among tall growing trees few, if any, surpass the native oak. It is a rapid grower and only needs a fair chance to prove its worth, but for best results it must have natural moisture. The method is to grow the oak from the seed. For wide avenues or for a single specimen, where the soil is deep and mellow, the elm has few if any equals. Its long slender branches, covered with deep green foliage, seem to be a standing invitation to enjoy its cool shade.

Of the eucalyptus family several varieties are highly ornamental.

Another very beautiful evergreen is the Grevillia Robusta or silk oak. As a sidewalk tree this is a great favorite.

As a single specimen for the lawn or small grounds, few, if any, equal the well known Magnolia Grandiflora. Its compact form, large glossy leaves, and immense pure white blossoms, always attract attention. The above are a very few of the taller or large growing trees of which there are many more deserving ones, but we cannot spend all of our time with this class and must pass on to our little favorites.

Here again the list is almost endless and I will only attempt to enumerate a few, among them acacias, camphor, crape myrtle, oleanders, syringa, lilacs, euonymus, date and fan palms and roses.

No class is more effective than palms. No lawn or farm looks complete without them. Classed as semi-tropic, they are perfectly hardy here and readily adapt themselves to almost all conditions of locality or soils.

The rose grown in bush form is one of the indispensables. From the native wild rose of wayside and meadow to the hybrid perpetual and tea, so common in our yards, all have their special points of excellence, so there is not much danger of making a mistake in selection. When color effect is desired, roses takes the lead.

Perhaps at this time it will not be out of place for me to refer to the action of the county board of forestry in calling attention to the trees and plants especially adapted to roadside planting, as this subject is receiving considerable attention all over the state. Among trees suggested for this county are the following:

Deciduous—California and American black walnuts, American elms, soft maple, several varieties of oak, Carolina poplar, Balm of Gilead, honey locust and others.

Evergreens—Olives, Grevillia, pepper, stercula, acacias, Monterey cypress, casuarina and eucalyptus. The above are recommended only for roads in districts where no power lines exist as they soon grow to interfere with the wire, necessitating the cutting away and disfiguring of the trees.

Among low growing trees and shrubs are the following: Loquat, oleanders, crape myrtle, date, California and Japan palm, camphor, largustrome (Japan privet) Laurustinas, altheas and so forth. With proper care all of these make beautiful specimens and are very effective on narrow roads and in front of small places or orchards where large growing varieties would not be desirable. Most of these varieties can be grown under power lines without any danger of coming in contact with the wire.

THE TREE THAT OWNS ITSELF.

Was ever anywhere but in the southland of our country such a sentiment for beauty and for gracious deeds as is shown in the story of the tree that owns itself? William Jackson loved a tree as some men love friends or fame or gold. And because he loved it so well he could not have it that axe or other ill should come near. And so he gave the tree its own splendid self to have and to hold, with a deed of all the land within eight feet of the tree to be its own, uninvaded by the greedy intrusion of man.

Now this was such an act of high sentiment as belongs to the days of romance and the knight of La Mancha. But it was done in our own land and less than 100 years ago. Moreover the citizens of Athens, Ga., where the tree stands, are worthy of this inheritance from their townsman of yore, since though the deed is not valid in law, they still hold it good in reality and will not have it violated.

A tablet stands near the tree bearing the following legend:

"For and in consideration of the great love I bear this tree and the great desire I have for its protection for all time, I convey entire possession of itself and all land within eight feet of the tree on all sides.

"WILLIAM H. JACKSON."

16 CENT SEED SALE

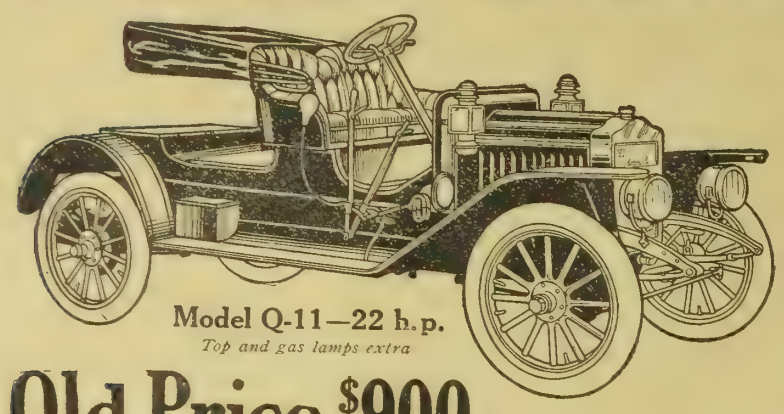
Famous Model at New Price



Model Q-11—22 h.p.
Top and gas lamps extra

$750

Including Magneto, 3 Oil Lamps, Complete Set Tools, Tire Repair Kit, Horn and Tube.

Old Price $900

PREVIOUS to January 1st this identical high-powered Runabout sold for $900. It was the greatest seller Mr. Maxwell ever produced. People realized its wonderful value and bought every one we made. Its success has endured because it is built right. During the unseasonable month of November, 1910, $1,125,000 worth of these machines were sold. Everyone marveled. We did ourselves. Most of these machines went to farmers in the Central West, who realized that a machine properly equipped was just as serviceable in Winter as any other time. On January 1st the industry and buying public marveled again when the Maxwell prices were reduced. In the height of our success prices were lowered. Why? Because when the Maxwell joined the United States Motor Company, we promised to give to the public the economies effected by this affiliation. It was able to do so January 1st, and did, although 95% of its cars were then sold to dealers.

You can afford this Car

High-grade, first-class in every particular, it is not only low-priced, but most economical to maintain. This is the car that demonstrated in public test last October, that it can be operated cheaper than a horse and buggy. As a money maker and time saver it cannot be beat. Speedy, with more power than you ordinarily use, it is an ideal Roadster for two. When you need room for four people, you can adjust a surrey seat in a jiffy. For hauling, errands, etc., receptacles can be put on and taken off in a minute. Everything conveniently located, comfortable, first-class and absolutely reliable.

Maxwell

What it means to you

Every farmer really and honestly needs an automobile. He needs it in his business, his family needs it for pleasure, health and recreation. It is the car you have waited for at a price you can afford. It's right in construction, power, appearance; it's simple to operate and easy to care for. It's ever ready in all kinds of weather, never tired, cannot be overworked and gives very little trouble. It costs nothing when not in use, doesn't die of overwork. No feeding or grooming—just a crank and you are off. Your increased earnings will pay for the car in 3 months. You'll have dividends in health, recreation besides.

Don't Fail to Investigate this Car

If you consider buying a car, this one deserves your closest attention. Don't part with your money before you know its wonderful value. At $900 it was the greatest seller ever produced. At $750 it is in a class by itself; it has no equal. After May 1st not one of these cars will be left. Better inform yourself now, and get in a reservation order.

These Books Free

We want to supply you with information on automobiles in general that will aid you in making your motor car investment. We have prepared booklets that tell the story from start to finish. Our "Farm Booklet," "How to Judge an Automobile" and latest catalogue are three books worth reading. They surely will save you money—cost nothing and involve no obligation. Send us a postal. Just say, *"Mail Books."*

LEMONS.

(Continued from Page 261.)

them up and let them work into the soil, making mulch and humus. Don't puddle the water around the trunk of the tree. Don't stir the ground when it is too wet.

Don't fail to pick your lemons once a month. Don't clip the stems too long. Don't clipper cut the lemons. Don't use sharp-pointed clippers. Don't drop the lemons into the sack; put them in carefully. Don't empty from sack to picking box without first turning picking box upside down to empty out any dirt, sand, grit or small sticks that might be in the box. Two or three sharp pieces of gravel the size of a wheat grain in the bottom of a picking box with the weight of lemons on it would puncture the skin of the lemon. The hole might be so small that it would go through the packing house and be packed up and started East to arrive decayed, and possibly four or five more good lemons around it, causing a discount on a good car of fruit.

Don't haul on wagons without springs. Don't think a gang of pickers after being started right and running smoothly for a day or two will go on that way without a foreman to keep the work up.

Don't fail to provide against frost no matter how "safe" you are, as one of our biggest growers says, which is a good rule: Put one oil or smudge pot to every four trees in a grove considered to be in a frosty district, but in one of the orchards in a "safe," absolutely free from frost district put one oil or smudge pot to every tree.

Don't fail to keep your lemon trees free of all insect pests.

Don't forget the lemon business requires eternal vigilance from start to finish.

"STOP THIEF."

"Who steals my purse steals trash, but he who robs me of my chance to get pure food is a murderer."

"Knock! Knock! Knock!"

We take these remarks from circulars issued by the New England Mineral Fertilizer and Chemical Co. We understand that these shots are fired at The R. N.-Y. Your humble servant is the supposed thief, murderer and knocker, and he is disposed to carry his honors easily. This concern is offering stuff as fertilizer which it claims contains in each ton 30 pounds of potash and five pounds of phosphoric acid. At regular market prices this means a value of about $1.75. The price charged for this stuff is $15 to $20 per ton. In our opinion any man who would be silly enough to pay such a price for this stuff does not deserve sympathy, but should be put in charge of a guardian. We stick to the old-fashioned truth that the only safe way to buy plant food is to figure on the value of the potash, phosphoric acid and nitrogen which it contains. Such powers of stealing, murdering and knocking as we possess will be exercised upon the guff, pious profanity and inane science which is used in floating so-called "fertilizers."—Rural New Yorker.

Some Californians also have an ambition to sell similar stuff for a long price. Like nursery trees, fertilizers should be bought of reputable firms.

The American National Live Stock Association, recently meeting in Denver, protested against the Canadian reciprocity treaty.

Live Stock and Dairy

Dairymen and stockmen are requested to write of their experience. Mrs. Sherman is always willing to answer queries and this, with experience of other workers, will make this department of greater value.

THE PIGGERY.

By Mrs. M. E. Sherman.

On the last run of the demonstration train we had an additional car with hog pens in it; four pens were built, expecting to have at least four breeds of pure bred animals represented. Two good Poland-Chinas grunted in one pen while two supercilious-nosed Berkshires were in the other. The other two were empty; neither Mulefooted or Duroc-Jersey could be found to fill them. At nearly the end of the run a young breeder at Clovis has offered to let us have a Duroc-Jersey bred in Illinois for the next run. The mule-footed or Chester Whites seem not to be obtainable at all. The advantage to the breeder should be considerable in the way of advertising to have their animals shown all over the country to farmers.

Car Windows.

The train in passing ran along by fields in which hogs were rustling for a living. On dry stubble fields they did not look particularly well or happy. When the grain of the season before has been short the combined harvester misses a reasonable amount that the hogs glean. When the grain has been tall, the gleanings are small, and I think most of the grain was tall last year. At least the hogs looked as though grunting was an effort too great to be considered. The hog is not by nature a ranging animal and does not thrive well for a long period when he has to rustle. He needs soft ground with succulent roots and nuts and grain to do well. These must be near enough together so he will not have to travel far between meals or at any time be a great distance from water.

Alfalfa.

Alfalfa alone comes nearer to being a perfect hog feed than any one food, yet it may be abused if the hogs receive it only. The old idea of hogs as an adjunct to the corn cob is passing and the alfalfa field is considered as the cheaper way to make a success of raising them. Anywhere the dairy cow can be fed on home-grown feeds is also the home of the hog. The hog thrives on a large variety of foods and his stomach and digestive juices are more nearly like those of the human family than the other animals. Like the human family his appetite cloys easily when fed continually on one kind of food. Therefore to gain rapid growth feed him a variety of food and never overfeed one day and give him too little the next. Green food should always be supplied, or if not obtainable, a good supply of pumpkins or pie melons may take the place as a part of the food. Skimmilk or buttermilk is always acceptable to his majesty the hog.

Barley.

Barley as a pig food was long overlooked in the West. It, as well as Egyptian corn, was fed whole instead of ground or rolled and the results did not compare with feeding corn. The hog soon tires of barley unless it is soaked in milk or water and mixed with something else. Cut beets are good, also pumpkins and a little middlings or ground wheat may be used. It might be said to feed whole Egyptian corn dry is to waste about half its value as a food, for the pigs cannot digest it all and it disagrees with them after a time. Barley produces the best bacon that is made. The Denmark hog is used to make the breakfast bacon that the English use as a daily breakfast food. So the hog of Denmark supplies the English king with his breakfast bacon, and that hog is a barley and skimmilk fed animal. That is surely going some for barley. One-third of the food used to finish the hog can be rolled barley to advantage.

Molasses.

Last year the advertisements for molasses for stock ran in all the papers and it has proven of value in feeding horses and cows in a limited way. The molasses available came from the sugar beets and as beet pulp was offered at the same time the two feeds are usually considered together in taking up a ration. The Utah station sent me a bulletin in reply to an inquiry on this point from which I take the following facts. Two and eighty-one hundredths pounds of beet molasses gave thirty-six hundred pounds of growth when combined with shorts and beet pulp, saving four and three-tenths of a pound of beet pulp and nine-tenths of a pound of shorts. Summed up this means that with pork at four cents a pound, molasses has a value of eighty-four cents per hundred pounds. These estimates are based on a price for beet pulp of a dollar a ton and for shorts of sixteen dollars a ton. With pork at eight cents a pound these prices could be doubled. I take these figures directly from the bulletin and I often think these experiments are interesting as an observation of the scientific mind at work in securing results that are hard and fast if it were not that in all animal life we are dealing with individuals and as these are not always the same the conclusions could not be disputed. The general results, however, may be accepted that there is economy in using molasses if the market price is right.

Beet Pulp.

Four and four-tenths pounds of shorts are required for each pound of pig growth when fed alone; when ten and one hundredths pounds of beet pulp are added to two and three-quarter pounds of shorts, the same pound of pork is produced. At four cents for pork, this gives the sugar beet a value of four dollars a ton. Sugar beet pulp is said to make a fair quality of pork when fed with shorts. The molasses fed pork is not liked, as it gives poor, greasy flavor and soft body to the pork. The addition of skimmilk to the diet of sugar beets and middlings, when the skimmilk was valued at fifteen cents, gave a feeding value to the pulp of 2.57 cents. The whole sugar beet has a value of $3.52 a ton in making a four-cent pork, while by the removal of the beet pulp the value is reduced to $2.57.

Pigs.

As the next run of the demonstration train comes into Los Angeles and the surrounding towns I hope that enough people will come on board and see those pigs and hear all about

THE PERCHERON SOCIETY OF AMERICA.

Has just taken over all records and business of Percheron Registry Company of Columbus, Ohio. 215 breeders took membership in P. S. of A. during December and January alone. 137 more new members added thru recent acquirement named above. There is now but one recognized Society in the United States recording Percherons. For information address WAYNE DINSMORE, Secretary, Union Stock Yards, Chicago, Ill.

the form and appearance of perfect specimens. The pig is the humblest of all our farm animals and usually receives only the leavings. He is a poor relation of all the other animals and has to take a back seat in the family gatherings. Yes! that was yesterday; today he is one of the best paying propositions on the farm and therefore when the money comes in for him this year just be honest enough to turn some of it back into making him comfortable quarters. This is the first grunt; the next one will take up Mr. Pig as he should be at home in the green fields he loves so well.—M. E. Sherman.

HOG CHOLERA.

All cases of hog cholera do not show the typical symptoms. Generally two, or possibly three, hogs appear dumpish; the eyes watery; later the lids may become adherent. There may be a slight discharge from the nostrils. In the course of a week or ten days these hogs go off their feed and are attacked by diarrhoea. The discharges from the bowels vary in color from black to grayish, are watery and a very offensive odor. They now appear tucked up in the flanks and possibly thumping may be noted. They rapidly become thin in flesh and finally too weak to move about, crawl under some straw and die. In a few days others become sick; those that were first attacked now begin to die, and in the course of three or four weeks, most of the herd may have succumbed to the malady unless remedial agents are administered and the ravages of the disease are checked. Pneumonia may accompany the disease, and when it is present, there may be noted accelerated respiration and a short hacking cough.

Autopsy.

There may be noted red or purple patches, particularly along the belly or flanks; this is particularly noticed in white skinned hogs. The ears may become inflamed and appear red and swollen. When the hog is opened, small hemorrhages may be observed on the serous membranes or linings of the thorax and abdominal cavity. Very small hemorrhages may be noted in the kidneys. The lymph glands (kernels) may show hemorrhage in them. When the bones are cut open, the softer, spongy parts may appear reddish black, due to hemorrhages. If the stomach and intestines be opened, areas in the stomach will be noted bright red. This is an area of inflammation, but may not always be present. The inflammation may affect only a part of the stomach. This inflammation may extend into the intestines. If the colon or large intestines be opened, there may be found ulcers varying in diameter up to one-half inch. These usually appear button like and are hence sometimes called button ulcers.

Treatment.

Intestinal antiseptics such as sulphocarbolate compounds have been given in the feed, or water or slop. This no doubt aids in warding off the cholera, but our experience shows that this kind of treatment has no curative properties.

The serum treatment is the only scientific cure for hog cholera. Many state experiment stations are preparing this serum. Some of the biological houses have also taken up the preparation of the serum, but the demand has been so heavy this year that many herds have suffered the usual loss when attacked by this disease. The serum could not be obtained.

The future should see an enlarge-

A Seven-Year Record

WITH A SCORE OF

100 Per Cent.

Have you ever thought of the tremendous amount of work that a cream separator is asked to do? No other farm implement is used so constantly, and none subjected to more strain.

Do you know what it means—all that it means—when we say that a United States Cream Separator on the farm of Mr. Lewis Richards of Carroll, Neb., has run more than 5000 times, without missing a separation, and with no repairs?

Then, do you realize what it means to you—a dairyman—when we say, and are glad to prove to you, that this is by no means a great record for the U. S.? That U. S. Separators bought nearly 20 years ago, are doing duty today, as they did in their infancy?

The United States Separator is built to skim perfectly. It does skim perfectly. It is built to wear for a generation. It does wear for a generation. It is built to give the utmost satisfaction, at the lowest price at which complete satisfaction can be bought. That it does this, thousands of users are glad to tell.

Will you be one of the fast-growing number of dairymen who have separator perfection in their dairies? A post-card today will bring you the "honest truths." Ask for Catalogue No. 20.

ment of these plants and others established at experiment stations, as the serum road is the only one to the conservation of the pork industry.—B. F. Kaupp, Colorado Agricultural College.

DAIRYING AND THE SILO.

Those who have been dairying long will recognize the wisdom of the following suggestions by a practical dairyman: In the eastern states where dairying is more prevalent than it is in the central west, one very seldom finds a farm on which there is not a silo. This is due to the fact that the experience of practical dairy farmers as well as experiments carried on by the experiment stations prove conclusively that milk and butter-fat can be produced more profitably where a portion of the ration consists of properly made corn silage than on any other ration that can be produced.

The increasing value of farm lands in the corn belt indicates that dairy farming will be much more prevalent in the future than it has in the past. As this condition gradually comes about, silos and alfalfa will spring up on every farm. Given good cows, good alfalfa fields—small but well cared for—and milk and butter fat can be produced more largely and with greater profit than by any other method.

No combination of factors is more conducive to prosperity, wealth, fertile farms and good homes than are well bred dairy cattle, capacious silos and productive alfalfa fields.—N. W. Pacific Farmer.

BRISTLES.

Regularity in feeding fattening hogs is very important.

Hogs know to the minute when feeding time comes, and if not fed will fret off part of their previous gain.

One thing that can not be overlooked in the growing of pigs and the fattening of hogs is pure clean water for them to drink.

One successful feeder always gives his hogs all the clean water they will drink before he gives them their grain ration.

Constipation is very rare in a herd of fattening hogs that have all the clean water they will drink.

Pure air, pure water, clean food, and a clean place to sleep make hogs profitable.

Smaller pigs are kept stunted if left with the larger, stronger ones by being crowded from the feeding troughs.

It pays to grade pigs carefully. Put the smaller ones by themselves and give extra care.

If hogs become lousy they never do well. They should be dipped in a tank or thoroughly scrubbed with a disinfectant.

Cleanliness with hogs will prevent disease.

Systematic disinfection of the hog quarters should not be neglected even if there is no disease.

"An ounce of prevention" applies with great force in the hog quarters.

All imperfect fruit and vegetables should be fed to the hogs.

No animal on the farm will respond to kind treatment quicker than the hog. And kind treatment means a good deal in the accumulation of marketable meat.

Hogs often get crooked legs for lack of exercise.

A bit of charcoal where the hogs can get it is the best kind of medicine.

Sour, bad-smelling feed is an insult to any hog. Give the very best and cleanest.—Farm Journal.

Do your cows milk hard? Send 50 cents for teat expander. O. J. Weber Co., 225-227-229-231 East Sixth St., Los Angeles.

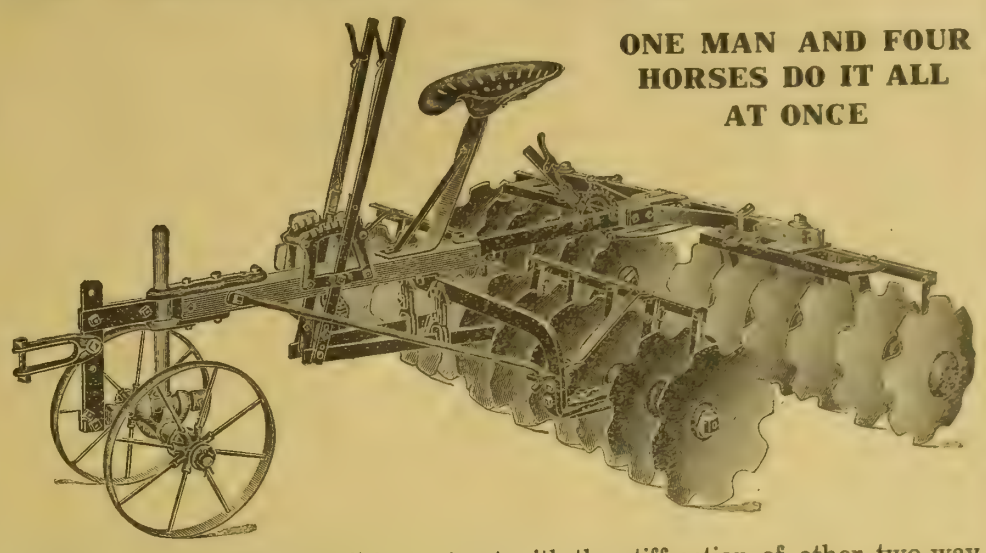
ARNOTT DOUBLE DISC HARROW

A Plow—A Disc—A Pulverizer—A Smoothing Harrow all in one

The SENSATION of the Day

Compare it Point for Point With Any Disc Harrow Made

Double Gangs
Double Cut
Double Throw
Double Levers



ONE MAN AND FOUR HORSES DO IT ALL AT ONCE

The flexibility of the **Arnott "Double-Cut"** in contrast with the stiff action of other two-way harrows is what is making it so popular. This flexibility is possible because of our Universal Joint connecting the front and rear gangs. For lack of this feature other double harrows have a good deal of side draft and will not make a square turn without digging a great hole. This can't happen on the **Arnott.** Independent front and rear levers within easy reach of rider.

PRODUCE MARKET.—Los Angeles Market; San Francisco Market; Citrus Market; 286, 287.

COVER CROPS.

This is perhaps the time of the year when the planting of cover crops has least interest. It is, however, a good time to observe the orchards in which it has been tried. Those which were not supplied with an abundance of irrigating water will probably make a poor showing because of the long drouth which extended well towards the end of January. It cannot be denied that some growers are discouraged and have decided to supply soil fertility in some other way, but the question of humus is everlastingly before us. All the fertilizer that can be applied avails little if the mechanical condition of the soil does not further bacterial activity. The only means, other than green manure crops, of supplying humus to correct this condition, is stable manure, and it goes without saying that the supply in this state is inadequate.

Unfavorable as the season has been, there are some magnificent crops this year; one instance is in the Limoneira orchards at Santa Paula, Ventura county. Regarding conditions there Mr. Charles Collins Teague, superintendent, writes:

"I am a thorough believer in cover crops and believe that there is no way that we can supply humus so cheaply to the soil, and that we also get much added value in plant food.

"Our cover crop this year is looking the best that I have ever seen it, that is, in all of our lemon orchards where we had an opportunity to put the crop in early. In our walnut groves where we could not sow until late on account of the harvesting of the crop, our results are poor and the crop will not be good.

"If one has an abundant water supply, I see no reason why he cannot grow a good cover crop, regardless of rainfall conditions. I am becoming more and more convinced that it is extremely important, however, to sow the crop early so that it may get a good start before the cold winter nights begin. Wherever we have pursued this practice, we have invariably had good results.

"We have used, quite generally, vetch in our old lemon groves this year and fenugreek in the younger groves where the ground is not shaded. We have been forced to the conclusion that the vetch is best in old shaded groves and that one will get a better crop under those conditions."

CHUCAWALLA.

As well settled as California is no month passes but that filings are made on several thousand acres of government land in this state. The one land office in the city of Los Angeles receives filings aggregating 100,000 acres yearly. Sometimes, as was the case about a year ago when the merits of a little valley north of the Colorado desert in Riverside county, known as the Chucawalla Valley, became known, there was a genuine land rush. At present the greater part of the filings are being made in the Mojave desert near the line of the Santa Fe in northern San Bernardino county. Development in all these sections will come as capital unites with the settlers in irrigation projects.

The Chucawalla Irrigation Company is renewing its work since the signing of the bill granting it permission to construct a dam across the Colorado near Parker from which to develop power to lift water for the irrigation not only of Chucawalla Valley but a great portion of the Palo Verde. Mr. R. M. Teague, in charge of the Chucawalla development, has a corps of engineers investigating possibilities of dam construction, and already two sites have been examined and abandoned because of unsatisfactory soundings. This scheme contemplates placing water on nearly a quarter of a million acres, thereby adding much to the prosperity of that section of California.

BEEKEEPERS CONVENTION.

The California Beekeepers Convention in session in Los Angeles this week is attracting greater attention than for years. The principal discussions have to do with practical matters of the apiary, but legislation and co-operation are also big features. The work of the legislation committee has been accomplished largely outside of the general sessions and the bill desired has been passed by the state legislature. It is hoped that the question of co-operation, which will be dealt with at considerable length, will lead to more profitable marketing of the products of the apiaries. The Cultivator will quote at some length from addresses delivered in its next issue, and a large number of papers which are now in the hands of Secretary Shaffner will be used in the bee department of future Cultivators.

"EVERY DOUBTFUL ORANGE A CULL."

The last Florida Grower contains ample illustrations of a new packing house just opened at Winter Park. It certainly shows that Florida is adopting modern methods. Automatic carriers, chutes for empties, and other features which have been common for the last two or three years in California, have been adopted. In the grading room a large sign carries this legend: "Every doubtful orange is a Cull." With this before them the graders will not discuss in their minds very long as to disposition of doubtfuls.

ABOUT OURSELVES.

We may be pardoned reference to the special number of last week and the overflow of business. We hope our citrus growing sections found it of value and all others in the state of interest. We were disappointed, and so expressed ourselves on the cover page in that the business office had become insistent for space for its advertisers and crowded over until this issue some of the good things we had procured. Even yet, Mr. Mills' article on citrus growing in the North is held over.

Speaking of advertising, it is in order to refer to the fact that over 95 inches, or over seven columns, of advertising space was also crowded out of last week's issue. As it was, there were 83½ columns, or a total of 1127 inches of advertising. This may be of little interest to the general readers of The Cultivator, but it is assumed they have a certain interest in knowing the paper which commands the greatest attention from those who wish to reach the producers of California. The larger business houses are learning that the cheapest way to reach California producers is through the columns of The Cultivator. We ask comparison of its columns with those of any other agricultural paper on the Pacific Coast, for we know it will be to its credit.

The dedication of the Roosevelt dam in the Salt River Valley, Arizona, is to be on March 18th instead of March 10th as announced in a former issue.

CITRUS FRUIT GROWERS MEETING.

Messrs. Pease, Yokam and Koethen of the State Citrus Convention committee have arranged the program for the three day sessions at San Bernardino, beginning next Tuesday. The program is excellent and should attract a big attendance. The various features are:

Tuesday, March 7, 10 a. m.

Opening exercises, appointment of committees, etc.

Soils—Dr. C. B. Lipman.

Subsoils—E. L. Koethen.

1:30 p. m.

Maintaining Soil Fertility—F. L. Palmer, Pomona.

Fertilizers and Plant Feeding—J. H. Norton, Riverside.

Plant Food—E. Babcock, Riverside.

Discussion—Carroll E. Smith, Redlands.

Evening, 7:30.

Control of Citrus Fruit—Conducted by Prof. A. J. Cook, Claremont.

Withertip—E. O. Essig, Santa Paula.

Organized Protective Districts—E. J. Yokam, Highland; C. N. Johnson, Rialto.

Discussion—J. F. Smith, Pomona.

Wednesday, 9:30 a. m.

Citrus Fruits—A. D. Shammel, Riverside.

Discussion—Fred Reed, Riverside.

Sub-Tropical Fruits—Prof. C. F. Baker, Claremont.

Cover Crops—Dr. C. B. Lipman, University of California.

1:30 p. m.

Standardization—J. W. Jeffrey, State Comissioner of Horticulture.

Organized Fruit Packing—B. A. Woodford, Los Angeles.

Discussion—Isaac Jones, Etiwanda.

Evening, 7:30.

Research in Fruit Decay—G. Harold Powell, Los Angeles.

Blemishes of Oranges, Physical and Pathological—Dr. J. Eliot Coit, Whittier.

Thursday, 9:30 a. m.

Regenerating a Citrus Orchard—Prof. Ralph E. Smith, Whittier.

Water Conservation—Francis Cuttle, Riverside.

Horticultural Quarantine in the South—Frederick Maskew, Long Beach.

1:30 p. m.

Function of the Citrus Protective League—G. Harold Powell, Los Angeles.

Discussion—A. G. Kendall, San Bernardino; J. S. Edwards, Redlands.

Necessities of the Fruit Tariff—A. F. Call, Corona.

Discussion—W. G. Fraser, Riverside.

BERKSHIRE CUP.

The secretary of the American Berkshire Association, Mr. Frank S. Springer of Springfield, Ill., writes that for the purpose of encouraging breeders generally to exhibit their herds at the state fairs of 1911, the association offers a solid silver cup to the owner of the best herd of Berkshires, consisting of a boar and three sows under one year, at each state fair that provides a separate classification for Berkshires. Animals farrowed after September 1, 1910, will be considered eligible to compete for the prize.

Many of the Eastern states are concerned over the fact that this is the year for the appearance of the periodical cicada, or, in more homely language, the seventeen-year locust. The department of agriculture has issued Circular 132 as to the probable work of this pest during the coming year. It contains descriptions of the insect, together with charts showing distribution.

Agricultural News Notes of the Pacific Coast

Northern California

The Cloverdale Citrus Fair is in full swing this week.

The first butter scoring contest at the University farm at Davis occurred last week.

The planting of almonds at Durham, Butte county, will be very extensive this season.

The work on the new cannery at Newark, Alameda county, is proceeding, and completion is scheduled for April 1.

San Francisco dealers report great quantities of oleomargarine have been sold in this state within the last six months.

Truckee's Snow Carnival brought people from all of the northern valleys to enjoy sleighriding and snowballing.

Humboldt was treated to a thunder storm last week, during which one cow was killed and a barn destroyed by lightning.

The concrete work on the headgates of the Sacramento Irrigation Company's main canal above Hamilton City has been finished.

The lease of a 1000-acre hop ranch at Nord, Butte county, has been made by the American Hop and Barley Co. of Henry Fraser of Nord.

A rabbit drive was pulled off at Hartley Corners, Sutter county, which resulted in bagging 295, which were turned into the San Francisco market.

The Santa Rosa Republican says "The banner county of the great state of California" receives more than $12,000 per day from her shipping yards.

Sacramento county land owners are concerned because of the filling of creeks from hydraulic mining, and are urging the Anti-Debris Association to take action.

Property owners of the Yolo drainage district ask that the boundaries of the big district be extended and an appropriation made to commence reclamation of vast areas in Colusa, Sutter and Yolo counties.

The last pay day of the Humboldt county creameries showed the following prices: Capital, 35 cents; Central, 34½ cents; Grizzly Bluff, 35½ cents; Swift & Co., 35½ cents; Libby, McNeil & Libby, 35¼ cents; Sunset, 35 cents.

President J. J. Alves, of the Sonoma Berry Growers' Association, has completed arrangements with the California Fruit Growers' Association for the handling of the crop of the members of the association during the coming season.

The Progressive Grange at Healdsburg elected officers as follows: Master, A. E. Burnham; overseer, W. B. Whitney; lecturer, A. R. Galloway; steward, J. T. Donald; assistant steward, J. O. Hicks; chaplain. Martha Watson; treasurer, G. H. Brigham; secretary, Phoebe Enzenauer.

The Sutter Almond Growers Association recently met in Yuba City and elected the following directors: E. S. Norton, president; J. W. Ainsley, vice president; Richard Walton, H. A. Carpenter, and J. F. Ogden. The representative or delegate to represent this association in the State Almond Growers' Exchange, B. F. Walton, was reelected.

Central California

Large plantings of olives will be made near Lindsay, Tulare county.

The effort to have a revision of the water laws of this state is again being made.

The San Joaquin reached its highest point in many years after the recent rains.

The supervisors of Monterey county are making a hot fight against ground squirrels.

The recent storm brought the Merced river to its highest point recorded since 1863.

Elimination of a large tract of land from the Kern National Forest will throw it open to entry.

Watsonville apple shippers had a large and attractive exhibit at the Sacramento Citrus Fair.

Several large tracts have been purchased in Fresno which will be subdivided into small ranches.

Commissioner Schulz of Tulare county reports orange stock coming to that section much cleaner this year.

A meeting was recently held at Watsonville to boost the poultry business and encourage greater egg production.

The management of the Tulare Creamery is elated over the fact of winning first honors in the last butter scoring contest.

Raisin vending machines, invented and patented by a Fowler raisin grower, have been installed in many Eastern sections.

A mass meeting of raisin growers was recently held at Selma, Fresno county, to discuss the big protective holding association.

Supervisors of Tulare county have declared war upon the squirrel pest and have passed an ordinance making destruction compulsory.

Santa Cruz county has one section where Jack Frost gives some snappy days. One morning showed a temperature of 14. The place is Boulder Creek.

The J. K. Armsby Company, which had agreed to purchase the Kearney Estate raisins of the regents of the state University, has been released from its contract.

The Danish Co-operative Creamery Association at Fresno has remodeled or practically rebuilt its creamery. The output is over a million pounds of butter annually.

The local of the Farmers Union of Selma recently passed a resolution against the Raisin Day observation on the grounds that it is not intended to benefit the farmers.

The Farmers Educational Co-operative Union at Evergreen, Santa Clara county, now has a membership of over 100. The regular monthly meeting was held last Saturday.

The committee in charge of Raisin Day is offering prizes for the best suggestions for schemes to make the day more popular. The only restriction is that it shall not cost to exceed $2,500 to carry out.

The creamery industry of Tulare pays the farmers of that section $100,000 per month, or $1,200,000 per year. A considerable part of the butter made in Tulare creameries is shipped to Southern California.

Southern California

Thinning of sugar beets has already been begun at Huntington Beach.

Paso Robles section is proving an excellent almond producer.

The Oxnard sugar people recommend the planting of 20 pounds of beet seed to the acre.

The fight of the Antelope Valley settlers against the former fence law is waxing more fierce.

A Redlands packer insists that this seasons' decay of oranges is due largely to too hard a pack.

A conference of tree wardens of Southern California was held in Riverside Tuesday, February 28th.

Fifteen carloads of Limas were shipped from Ventura last week, going by water all the way to New York.

Friends of the new U. S. senator, John D. Works, assert that he will stand for protection on all California fruits.

The reclamation service has insisted on the removal of the piling across the Colorado at the Imperial Valley intake.

A Los Angeles concern has purchased a tract of land near Coachella. Wells will be sunk, lands cleared and subdivided.

A new irrigation company has been formed at Covina for the purpose of placing water upon a tract of land on South Citrus Avenue.

Twenty-four thousand trees of the El Cajon Valley, San Diego county, have been thoroughly fumigated during the last season.

Farmers of the Coachella Valley are discussing the possibility of securing waters of the Colorado by organizing under the Wright-Bridgford Act.

The management of the National Orange Show to be held at San Bernordino March 6-11 reports all space taken and promise of a big show.

Borings of the engineers for the Chucawalla dam have found it necessary to move farther up the Colorado in order to secure better foundations.

The new officers of the Kerman Creamery are: N. E. Carnine, president; Emil Jung, vice-president; H. Kressman; H. Wiese is superintendent.

The Bardsdale Heights Citrus Company has recently been formed with the following directors: George N. King, president; I. P. Browne, C. L. Sheldon, B. C. Hedrick and A. L. Shively, all of Santa Paula.

A. R. Rideout, of Whittier, Los Angeles county, has just shipped a carload of grafted walnut trees to the Los Angeles Suburban Home Company of San Fernando; 6,000 trees, mostly Chase walnuts, for $6,000.

The advantage of California as a cotton producer is proved by the fact that picking is only barely finished in the Imperial Valley. Total results are 5,500 bales, of a value of $385,000. Seed produced aggregates 2,750 tons.

The Pacific Land and Products Exposition to be held in Los Angeles March 18 to April 2 is the first of its kind to be held on the Pacific Coast. Over $50,000 has been subscribed for preliminary expense, and the claim is made that 200,000 Easterners will visit it.

The Coast

Timothy hay at Spokane is selling at $23 per ton.

The Oregon agricultural college has just issued its biennial report of 72 pages.

Farmers of Idaho are planning for a state fair to be held this year at Boise.

A farmer at Dallas, Oregon, boring for artesian water, struck a flow of oil.

Apple growers of North Yakima, Washington, have decided on standardizing.

Great numbers of laborers are on their way to the salmon canneries of Alaska.

Elk are dying in great numbers because of the deep snows near Bozeman, Montana.

The Arizona Cattle Growers Association held its annual meeting in Tucson February 13.

The State University of Oregon, lolated at Eugene, is gratified at a greatly increased attendance this year over last.

The state bureau of statistics of Washington is securing information as to advantages of grain on logged-off land.

The legislature of Washington reduces its levy for state road purposes, last year nearly a million, to about $500,000.

Plowing began earlier than usual near Walla Walla, Washington, some fields being turned as early as the middle of February.

The Hood River apple growers sent delegates to the Western Fruit Jobbers Convention at Sacramento in order to acquaint the fruit handlers with their fruit.

The Mindanao Horse Show and Live Stock Exhibit held early in February made a showing of a type of animal far in advance of those generally in use over the island.

The Judith Basin in Montana reports winter wheat in remarkably good condition, with flax ranking as second in importance in the state's agricultural products.

The Tri-state Convention of the Co-operative Union, meeting recently in Walla Walla, Washington, demanded parcels post and prohibition of gambling in futures of grain.

The Hawaiian Islands are investigating the feasibility of drying bananas. Banana chips find ready sale in Germany. The production so far is almost wholly in Jamaica.

Banana culture is being extended more every year in the Hawaiian Islands, and interest is now being manifested in the production of cloth from the fiber of the plant.

The Hood River Apple Growers Association has employed apple expert Lawrence, from the agricultural college, to visit various apple sections and give information as to best cultural methods.

Northern Idaho farmers recently met at the state university and discussed swine culture. Berks, Poland-Chinas and Durocs were the favorites, with Chester Whites showing many friends, though admitted subject to sunburn.

1911 SEED CATALOG

If your name is not on our list, please send us your address for a copy. It is a good one, well worth having; sent free and postpaid. We have secured the California agency of the

Prairie State Incubators

The best—bar none. First carload selling fast. Come in and see them—or send for Prairie State Catalog. We also have a carload of the

Baby Buckeyes
50-Egg Incubator for $7.00

Purchaser can operate it for forty days, and if it does not meet with his entire approval, it may be returned to us and the price paid will be promptly refunded. They go like hot cakes. If you cannot come in, send for a Buckeye Catalog. When the chicks are hatched, don't forget the old reliable

Proven to be the most successful Brooder Stove on the market. Awarded gold medal for most Meritorious California invention at California State Fair, Sacramento, September, 1910. Burns distillate, perfectly simple and easy to manage. Write for details. **H. F. ARENBERG, Petaluma, Cal**

Practical Poultry Culture

RAISING CHICKENS FOR PROFIT.

By R. T. Lyans.

Nearly every one can raise chickens providing they have good sound minds and use good common sense, but how few know how to raise chickens for profit. Many people raise chickens for recreation and the pleasure to be derived from it, while others have chicken raising as their hobby. These people are among the wealthier class and consequently do not care for expense. Because of this fact they spend lots of money carelessly for valuable birds and fail to manage them properly to derive a profit. This is because of their one purpose in view, —pleasure. On the other hand the greatest number of chicken raisers in the country are in the business for the profit in it, solely, and because they do not take pleasure in their work they think the greatest profit to be derived in raising chickens comes to him or her who invests the smallest amount of capital and gives the least amount of labor to the business; who never buys a pure-bred male to improve the flock and who never thinks of the ration to feed a growing chick. The outcome of it all is that profit never comes to bless the owner. But the man who combines pleasure and profit is the man who will always succeed in the chicken business, which, by the way, is not a "get rich quick" business. To the man or woman who thinks differently the best proof is for that person to just try it once and see. A few years experience will soon bring out just how little one does know. Raising chickens is a vocation in itself and the one who raises chickens just for pastime can never realize much profit for them. Attention to business is one of the fundamental rules of success in any business, and it must apply here as well as anywhere else. Every little detail must be worked out individually, if not by experience directly, then indirectly it must be fathomed.

When we can learn by the experience of others and profit thereby it is not nearly so costly, and every idea gained can be put into operation with so much greater surety of its being a success. Then it naturally follows that one should read the best poultry literature obtainable. By this it is not to be inferred that one should raise chickens by a formula or any book method, because directions that might possibly be good for one breed of chickens, or chickens of one age, would not be good for others; or possibly two chickens of the same age and breed would need different care and feed because of their different individualities. Book learning is good but experience is much better because good books come from experience. Thus it is well to read of the experiences of others in books, papers and journals, and thereby get pointers and ideas from them which are practical and weighty, but care should be taken in putting into operation whole systems or methods of poultry raising described in literature because of the lack of experience in that particular system. The up-to-date poultry raiser is a subscriber to at least one or two good farm and poultry papers, and the result is that nearly every week he finds a few pointers that help to guide him over the ruts that lie along the pathway of the chicken raiser. For anyone just embarking in the business for the first time it is never advisable to invest too much capital at the beginning because of the fact that one does not know all the details which must be worked out later. It is a business that must be worked up gradually as any other business and the operator must grow up with the business. Success never comes in leaps and bounds but by persistence and patience, and so it is always well to go easy at first. Whether one is to make the poultry business a profitable one depends on the kind of care and the methods of management. If good care and management have been given and the business has proven a profitable one then it is wise to add more capital to the business.

Location.

One of the first things that the beginning poultry raiser has to look for is a location for the poultry plant. An ideal place for this is in an orchard with an eastern or southern slope to obtain plenty of sunshine; thus combining the fruit and poultry farms which has proven to be a happy combination, as the products of one builds up the other, and vice versa, and there is practically a double crop from the same farm, and the fertility that is added to the land by the chickens is no small figure, being easily worth at least one-fourth the feed bill, and consequently an allowance must be made for it when figuring out the profit or loss on the books. The best soil for chickens is a sandy loam which is always dry and provides a good place for them to scratch.

Egg Production.

Large hens do not as a rule produce as many eggs as smaller hens, but they produce larger eggs and just as many pounds perhaps in a given time. It would seem, however, when eggs sell by the dozen the small hen would be the best. This would be especially true if one were speaking of two hens of the same breed, but when comparing two different breeds it does not hold true, as just as good layers have been raised from some of the larger breeds as have been produced from the smaller ones. Any of the standard breeds are good if handled right. The hens should be kept in small flocks to get the best results. This rule will hold good in breeding any kind of livestock or poultry. Not over ten or twelve hens should be kept in the same pen. It is not necessary to keep a male bird in the pen if the eggs are not to be incubated. One of the best secrets of a large egg production is to get the hen that matures the earliest, thereby giving her a longer season to produce, and one that lays her eggs during the period when eggs command the highest price. This latter can be accomplished by selection of hens that lay well during the winter, and the winter layers are nearly always early matured fowls. But the matter of feed is perhaps the most important of all. While it is important and essential that the hen has a comfortable roosting place, a clean pen, fresh water, plenty of grit and oyster shell, and a good place to scratch, that is not all by any means, for she must have a large variety of feeds besides, such as wheat, oats, corn, and plenty of bulky food such as clover, alfalfa, and other grasses, and she should have whole wheat bran

60,000 "Queens" in the Contest

all along the line last year, and the Queen never fell behind. Friends, you will be interested in knowing about the uniform big hatches produced by the

Queen

It is the dependable hatcher under *all* conditions, in *everybody's* hands.

Eucalyptus

All varieties and sizes; extra hardy stock. "The finest trees I ever saw," is the verdict of all who see them. Write today for free booklet C on their culture, etc. Questions gladly answered.

LLOYD R. TAYLOR, Modesto, Cal.

before her at all times. Never starve a hen, as she is a machine and only works on full feed. If fed good clean food the hen should be giving you an egg every other day on an average, and if she fails to reach this mark it is time to begin the culling process and get rid of all the poor layers. Thus is seen the folly of investing too much capital at first before a good laying strain is established. Keep records of the hens so you can tell which are paying for their keep and yielding a profit besides. It is quite easy to do this when there are not too many hens in a pen. It will cost from $1.50 to $2.00 per hen to produce 12 to 16 dozen eggs which at an average price of twenty-five cents would bring three to four dollars per hen, showing a profit of $1.50 to $2.00 per hen, which is very good for egg production alone.

Broilers.

In selecting broilers one should select the larger hen which will lay a larger egg supplying more food material to the growing embryo and consequently producing a larger chick which will develop into a larger and earlier maturing bird which is preferable for the market. Such chicks consume an enormous amount of feed and they should be forced from the start to produce the best results. Corn must be fed in large amounts, as it is very difficult to fatten a growing chick. Good clean milk is a fine food for growing chicks and should be fed very liberally if obtainable.

Pure Bred Stock.

It does not cost any more to feed a pure-bred chicken than it does to feed a scrub, and there is much more pleasure and profit derived from raising the pure-bred fowl. Supposing for illustration, a $5.00 hen lays 50 eggs which when hatched grow into 50 $5.00 chickens, $250.00. It would take 5 $1.00 hens to lay 250 eggs which when hatched and grown would be worth the same amount. There would be five times the care and risk, and five times the cost in feed in the case of the 250 ordinary chickens with the same investment. The fact that all prosperous breeders of chickens have pure-bred stock is proof enough in their favor. Much could be said about line and cross breeding, and breeding for fancy and exhibition stock, but space will not permit here, and besides those are problems which the breeder must work out for himself, so let it be said in conclusion that to raise chickens for profit one must take an interest in his or her work, watch every little detail closely, and take advantage of every opportunity for improvement, culling out every bird that does not prove itself worthy of attention, and through carefulness, patience and perseverance your efforts will at last be crowned with success.

There is no green food that is equal to chopped onions, though they are too high in price to feed very often. If your fowls get to sneezing and show symptoms of cold, give them a lot of chopped onions, all they will eat, and the chances are that the cold will be cured.

Allow one bath pan for every twelve pairs of birds in the loft.

MEDITATIONS OF MAURICE O'REELYUS.

There's nothing (not even this observation) new under the sun. Take the chicken business, for an example. Adam kept a bunch of them on his ranch and we are invited to believe that Noah took a breeding pen to sea with him. "Chickens on a city lot" was practiced in Jerusalem in the first century of our era, for it is on record that St. Peter heard a rooster crow more than once in the same night and right in the business part of town. The Biblical reference to the hen gathering her brood under her wing does not preclude the supposition that some wise guy was running a fireless brooder in his back yard. And incubators! Why, at the time the silk industry was introduced into Europe—way back yonder before it got started in San Diego—eggs were hatched by the heat of manure. It is true they were silk worm eggs smuggled out of China, but "eggs is eggs." And when it comes to "Poultry for Profit," what was the matter with John Ducas Vataces, one of the emperors who helped to close out the Roman Epmire in the East? Listen to Gibbon: "And when Vataces presented to his empress a crown of diamonds and pearls, he informed her, with a smile, that this precious ornament arose from the sale of the eggs of his innumerable poultry."

He doesn't say whether they were cold storage or strictly fresh, candled or case count, but it is a safe bet they were not paid for in trade.—Escondido Times-Advocate.

The person who is enthusiastic over what his hens are doing is all right as a poultryman. He may not be familiar with fine points, but he is getting results. He is taking good care of his hens and that is of first importance.

It will pay every owner of a flock of poultry to sit down and figure out what can be done to lessen the amount of labor required daily. One will be surprised to find out how many useless steps are taken in the care of poultry on most places.

Don't mix in a few good birds with the culls when marketing, thereby expecting to get a better price. It works the other way every time.

As with other animals chickens must be induced to consume large quantities of food to become heavy producers.

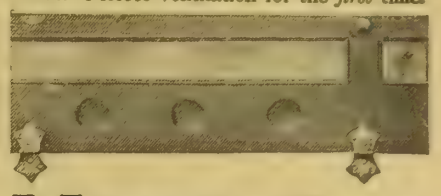
If you keep mongrel or crossed hens, buy a well built, vigorous male and see how much bigger, better layers and more uniform the chicks will be next summer.

The experienced poultryman breeds only from his best winter layers. It is then when prices are at their best, and profits are to be counted upon in the poultry business.

One important item in fattening fowls economically is to supply the food in a way that is easily digested.

More Inventions by Lee

Here's his new Incubator door all are talking about. Perfect ventilation for the *first* time.

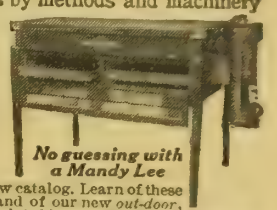


Mandy Lee Incubators

supply life-giving oxygen freely to the eggs and just as naturally draw off the poisonous gases. The most important step ever taken in incubator ventilation—neither above nor below, but *right at the eggs*—the correct principle, for the new Mandy Lee is making better hatches of *stronger* chicks than any other incubator in the world.

We Measure Everything

Heat—moisture—ventilation. You *guess* at nothing. If the eggs are good and you follow simple directions your work with a Mandy Lee is as nearly an absolute certainty as anything can be. There is no more reason why you should buy an incubator that regulates nothing but heat than for a farmer to continue to harvest his crops by methods and machinery used 100 years ago. Your success with poultry depends on your ability to select equipment that is *right*—that's what you *always* get from us.



Send *to-day* for new catalog. Learn of these new improvements and of our new *out-door, lamp-heated* and *regulated brooder*, just what is needed.

Eggs for Hatching, January to June. Day Old Chicks, March to June.
PASADENA, CALIFORNIA.

PHENOMENAL STRAIN OF

S. C. R. I. REDS

These hens equal any breed for laying purposes on the Coast; this is their eighteenth month of steady laying, averaging higher in January 1911, than in January, 1910. Cup and ribbons to their credit.

Settings $2 and $5, by the hundred $6, $8 and $10.

"THE LUEDKE'S"

R. F. D. No. 1, ANAHEIM, CAL

Good ventilation is necessary for the health of fowls. See that the chicken house is large enough and has a free circulation of air these warm nights.

Regulate the number of hens to the size of the yard and house. Don't keep too many, but keep good ones, and then give them good care. That is the secret of success in poultry raising.

A GOOD RECORD.

I have often seen, in your columns, egg records for the year from different numbers of hens, and would like to give you my record and how I did it, as I would like to have some expert in the business comment upon it, for my betterment.

We have nine hens, Barred Rocks, which from February 15, 1910, to February 14, 1911, inclusive, laid 1,634 eggs, or five over 181 each. No hens were allowed to set, and as no sickness prevailed they were kept busy all the time. There was but one day in the year that no eggs were laid, lots of times nine were laid, and one day nine were laid in the nests and two on the dropping boards at night.

We feed as follows: One ounce wheat in the litter in the morning, one ounce Coulson's egg food at noon, and one ounce sprouted barley at night, per hen. The ounce of barley is weighed before sprouting, and the egg food is fed dry, sometimes reducing it half when a quart of sour milk is given or a half ounce of cracklings.

In addition to this, shells and sand are supplied at all times, with chopped alfalfa two or three times a day. On cold nights a little whole corn was fed, and on cold mornings a nice pan of hot water was provided for the biddies.

As we are new in the business, we should like to hear from someone who has a better plan of feeding and care in general.

Are we feeding enough? Is the kind and quality right?—E. B. Stone, Campbell.

* * *

A good record—an excellent record. The best answer to the questions as to feeding enough is Mr. Stone's own figures. We realize "the 200-egg hen" has been claimed so often that the 181-egg record of this pen doesn't look startling, but it is far above the average, and at low cost.

The best part of it is that the carefully kept record enables the immediate tracing of profit and loss.

It's a helpful letter. Let other poultry people give of their experience, and give a better ration.

A CHICKEN BOLD.

He was a fluffy yellow chick, not long
out of the shell,
But oh! the wondrous thing he did
you should have heard him tell.
When he was but a few days old, he
wandered off afar
Beyond the coop, without asking leave
of his mamma.

In truth, a daring soul was he, for
where a recent rain
Had left a pool he tumbled in—and
tumbled out again.
And though a small log lay across and
barred his way before,
He cried: "Oh, what a horrid hill!"
and tried to scramble o'er.

Quoth he, when back: "I flew so far
my head just fairly whirled;
I've climbed a mountain, sailed a sea
and been most round the world."
Such news, be sure, quite startled his
mamma and all her troupe,
But the traveler bold, that night, alas!
was nursed for chicken croup!

Prevent disease among the fowls rather than risk curing them. Keep the quarters clean and supply pure water.

Roup, chicken pox and sore head are caused by damp quarters. "An ounce of prevention is worth a pound of cure."

Color of the egg shell is important in meeting the demands of the market, but it has no relation to the nourishment in the egg. The white shell egg is as nutritious as the brown shell.

Do not keep more breeds of poultry than you can keep to breed in strict purity.

Coulson's

MADE IN PETALUMA

Special chick food

If nature hatches the egg, you should save the chick. And you can do it with Coulson's Special Chick Food—the greatest life-saver known in the chicken industry.

This food is the result of years of study to get just the right ingredients in a proper mixture to save the largest possible number out of every 100 chicks.

Coulson's Special Chick Food is an investment, not an expense. It pays big dividends by starting chicks on the road to profit for you. Costs about one cent a chick for four weeks' feeding.

Coulson's Growing Chick Food must be used after the first six weeks, to keep up the steady growth of the chicks up to three months, at which time they are old enough to use Coulson's Egg Food—the standard feed for laying hens.

At your dealer's or from us. Write for the interesting book, "Poultry Feeding for Profit." It's free.

Entomology and Bees

HOW A BEGINNER MAY DETECT FOUL BROOD.

Every one of us who has a swarm of bees is interested in keeping them in healthy, vigorous shape, so they will return the largest amount of honey. Foul brood is the only serious disease which affects our colonies, so that the man who understands the curing of this disease need fear little trouble from bee diseases. We are not troubled with the moths which work such havoc in the East, and the wintering problem never causes us the worry that the Eastern bee keeper becomes subject to.

Foul brood, however, is a serious menace, for I know of no way of preventing it entering my bee yards unless I personally inspect and care for all the bees within flight range of my bees. Naturally, this is a physical impossibility, and so the only feasible course for me to follow is to keep a sharp lookout among my own bees, and, whenever the disease appears, treat it at once, or as soon as suitable weather and honey flow conditions permit. Some destroy every hive that they find infected; this is a heavy loss, and more saving methods can be followed and be just as sure in the long run.

The disease is the dying of the young larvae just before or directly after the larvae has entered the pupa or metamorphic stage of development. The disease is caused by plantlike growths which develop from spores in the honey which has been fed to the young larvae or little white grubs. These spores quickly develop into these minute growths and multiply very rapidly when they find themselves in such a warm, congenial atmosphere, with an abundance of rich food in the shape of the soft body of the grub to feed upon.

Now, healthy larvae are always white, and have the full round worm shape before and for a short time after being sealed over by the bees, which is the beginning of the metamorphosis from the worm to the perfect bee. When the larva dies from the effects of the foul brood germs it sinks down onto the lower side of the cell in a brownish, ill-smelling mass, and by inserting a toothpick into the mass it will rope and stretch out, clinging to the end of the toothpick like a mass of glue. This is a sure test, and is really the only one to be depended upon, for sometimes the brood becomes chilled and dies, turning a little dark in color, but never getting such a deep color and never stretching out the way foul brood does. If but a very few cells are found, the hive should be marked and the entrance contracted to the very least space that the colony can stand.—Ranch and Range.

BEES ON SHARES.

Many a bee man gets a start with bees by renting bees from those who have more than they care to handle. The share given runs from one-fourth to one-half of the crop going to the owner. The half and half share is the most common rate paid, and when this basis is used the parties divide all expenses for supplies, location, rent, etc., between them; and, in dividing the crop secured, each takes half of the increase, wax and honey. Around Boulder this year our crop was nil, and a bee owner approached me with the question whether the man renting bees should not furnish half the sugar to feed those that needed feed for winter. This brings up a new point in renting bees that I have never had brought to my attention. I should say that the renter puts up his work against the caiptal invested by the owner in his bees, and, if there is a failure, the bee keeper loses his time, and the owner loses the income from his investment. Unless the bee keeper specifically guarantees the original number of colonies to the owner, I do not think anyone but the owner should put up the money to buy the feed for the bees, should they need it. The owner should stand all the loss that the bee keeper is not directly responsible for.—Ranch and Range.

GREAT NATURAL RESERVOIR.

The rock crust of the earth is a vast reservoir, more or less water-saturated, and the intelligent man will make a study of the natural conditions of his own farm if he would secure its best water development. Well watered farms, those which have a pure and ample supply in every field, are the most valuable, and with a little more basic knowledge than the owner may now possess, he may be able to very easily and cheaply bring about such an ideal condition.

The Hessian fly is so called from the fact that it was brought to this country in straw, used in 1776, when the Hessian cavalry was imported to fight the Americans. It made its first appearance on Staten Island, near the stables of the Hessian troops, and soon traveled over Connecticut, spreading throughout New England and the West at the rate of twenty miles a year.

Robbie ran into the sewing room and cried:

"Oh, mamma- There's a man in the nursery kissing Fraulein."

Mamma dropped her sewing and rushed for the stairway.

"April fool!" said Robbie gleefully. "It's only papa!"—Everybody's Magazine.

Questions and Answers

THE EDITOR AND STAFF

Questions to be answered in this department should be received at this office one week before reply is expected. Write plainly on one side of the paper and sign full name and address. Unsigned communications receive no attention.

Horticultural Law.

Is it possible to prevent land owners from allowing morning glory and other noxious weeds to go to seed? There are instances where threshing machines carry seed from farm to farm because the morning glory is allowed to come up in the grain. If there is a law against allowing this, who should be appealed to for enforcement?—Subscriber, San Luis Obispo.

Apply to your county commissioner. According to the last information we had, your county had not yet appointed such commissioner. If this has not been done every farmer and fruit grower should urge immediate action. The county's loss from the scattering of noxious seeds and pests far more than covers the cost of maintaining the commission.

Barley for Chickens.

Is there any safe way to feed whole barley to chickens, by soaking it, for instance?—J. B. L., Kingriver.

We have heard of whole barley, rolled barley, and soaked barley all being fed to poultry and never heard of its being unsafe under any of these conditions. It is claimed by many that soaking until it sprouts is the way to secure greatest good from barley feed. The sprouting requires but a few days and is well worth trial. Some think it better even with rolled barley to soak before feeding.

Drying Off Cow.

I saw in one of your issues not long ago, "To dry up a cow milk about half of the milk out at each milking." Don't do it. It is one of the worst things a man could do especially for a young cow, to get her in the habit of holding up her milk. The proper way is to let the udder become full and quite feverish, then milk it all out and apply camphor diluted with alcohol. That will dry her at once.

And for treatment of bloat. Don't use a hose or bother with one. Use a trocar or knife and it will give instant relief.—Subscriber, Highland.

Walnuts Not Filling.

I have ten acres of 18-year-old soft-shelled walnut seedlings which last year bore eight tons of nuts, but the meats were not so well filled out as they should have been. Soil is light loam, very deep. Plenty of water. Vetch sowed last winter made fairly good growth and was plowed under in March with 3000 pounds of superphosphate. Applied black eye bean straw heavily the last four years, and at present land has a crop of vetch growing on it. It has never had any nitrate of soda or potash. Would it be best to try some of each, and how much?—Subscriber, Fillmore.

This question is a hard one but is likely a shortness of fertility, as well as short supply of water at the time the nuts were filling.

There was considerable complaint of light walnuts last year and the cause has not been determined in many cases. This soil being a light loam it is possible that it has not a sufficient supply of plant food and as we know the soil all over California needs phosphorus it will be well to continue putting on superphosphate at the rate of 300 to 400 pounds per acre, broadcasting it and plowing under at the time the green manure crop is turned under. If the trees are not making a good growth, with dark green leaves, it would be well to apply three pounds of nitrate of soda per tree, covering all the ground, about April 1st, if the plowing has been done; if not plowed, the nitrate can be put on when the plowing is done. Then make another application of nitrate of soda, two pounds to the tree, six weeks later.

Be sure the irrigation is well done and that the trees never want for moisture, but do not put on water enough to leach out the nitrate of soda. This can be determined by digging down in the soil and finding where the water goes. The soil should be wet to about four feet deep 24 hours after the water has stopped running, but should not go farther in that time, as the nitrate will go on below the roots and be lost. The fertilizers that have been supplied are of the best, provided there has always been sufficient moisture and the bean straw has been cut down with a disk harrow, set straight, so the rough material would decay readily. The vetch should be plowed under before the straw begins to harden.—J. B. N.

"Up a Stump."

In your issue of February 9th you referred to the possible cure or prevention of chlorosis by use of lime. Now, according to Circular 27 issued in October '06 by the University of California, as I interpret it, lime may be the cause of mottle leaf. Which is right?—Subscriber, Highland.

This question, like many others relating to soil chemistry and physics, is worthy of far wider discussion than can be given in these columns, and is one on which there is great difference of opinion and lack of absolute knowledge. The article appearing in The Cultivator of some weeks ago by Dr. Snowden maintains that chlorosis is usually caused by excess of magnesia over lime. If Dr. Snowden is right, the addition of lime will prove beneficial. Hilgard in "Soils," says: "In general it is best that lime should exceed magnesia in amount." We hope to have more extended discussion of this question in the columns of The Cultivator.

Nitrate of Soda.

How much nitrate of soda will an orange tree stand at one application? Will it absorb all the good from ten pounds applied at one time?—Subscriber, Highland.

We would surely make three applications of the ten pounds. Without excessive irrigation or rains it possibly would not be lost if all applied at once, but by far the safer plan would be to make three-pound applications.

Red Spider on Almonds.

At what time and how should I treat almond trees which have been defoliated in past years by red spider?—Subscriber.

This inquiry was referred to Mr. J. P. Dargitz, manager of the California Almond Growers Exchange, and he writes: "Replying to your inquiry in regard to the handling of almond trees to prevent the depredations of the red spider, will say as far as our experience goes the red spider is dormant and harmless except in hot weather, but wherever it is present in hot weather it will do its work and will multiply rapidly. There is one remedy which is par excellence, and

The Luitwieler Non-Pulsating Pumping System

Deep Well Pump Talk Continued:

Cut shown is of the Assembling Room of the Luitwieler Factory. Luitwieler Pumps are built in large numbers at a time with all parts interchangeable. The Luitwieler cam is the only mechanism applying the power uniformly throughout the full stroke, thus doing the same work with less power than any other method and with longer life of working parts.

Luitwieler pumps have worked steadily for eleven years without any repairs. The Santa Fe Railroad has 26 in use. Of course THERE'S A REASON. They give more economical and satisfactory results than any other way of lifting water. Pumps for every service. Thirty-four years' experience in Los Angeles.

Water Tank

that is the fumes of sulphur evaporated by the hot sun. The treatment wherever the red spider is present is to blow fine sulphur among the trees; the finer it is the more rapidly it will evaporate in the heat of the sun, and the fumes from this evaporation will kill the spider. Twenty to twenty-five pounds of sulphur together with a like amount of lime dust per acre will be a very good treatment, the dose repeated in one week if necessary. This treatment will very thoroughly control the red spider and it is not expensive. Common dust spraying machines are very effective and economical in the matter of scattering this dust among the trees. The effect of the red spider will be noticeable in hot weather by the leaves turning yellow; first a very pale green, then a light yellow. Whenever the dark green begins to fade out of the foliage lose no time in getting the sulphur scattered through the trees."

Food Value of Sorghum.

What is the value of sorghum as a milk producer compared with alfalfa; also the best way to feed, whether to cut at or before maturity.—Subscriber, Hynes.

Sorghum is not intended to supercede alfalfa, but to supplement it as a feed. It is grown on land that is used for winter growth of grain hay, and fed green to secure its greatest value for milk cows. The cutting should begin when the first swelling of the sheath of the head shows. Green sorghum contains 79.4 water; protein 1.3; crude fiber 6.1; nitrogen free extract 11.6. Green alfalfa contains 71.8 per cent water; protein 4.8; crude fiber 7.4; nitrogen free extract 12.3. Sorghum should be cut at this same period of maturity when made into hay as the stalks grow very coarse and woody when the heads are developed and are not relished by the cows.—M. E. S.

Stringy Milk.

I have a cow that has been fresh since June, 1910. She seems perfectly well, but after the cream has stood a while after being separated it becomes slimy or stringy.—Subscriber, Lodi.

The usual cause of stringy milk is bacterial and comes from outside of the cow. If you are certain it is from the cow give her a dose of epsom salts, one pound, and one tablespoonful of ground ginger. Give this in a large quantity of water. If you have never drenched a cow better have some one to show you how so as not to get it into her lungs. A simple remedy for this is to give a teaspoonful of bisulphide of soda in the grain fed and it is easier for a woman to do than to drench the animal. Give this soda every day until the trouble stops. This is taking it for granted that you are sure that the trouble comes from the cow. Personally I should look for it outside the animal and begin by washing the cow's udder and teats in water containing a teaspoonful of creolin to the quart and dry them carefully before milking. I would whitewash the stall in which she stands and clean out the earth, putting in fresh soil in the stall if it is a dirt floor. Then I should go over with a strong sal soda water all the pails that are used in milking and everything in use about the milk. After using the hot sal soda water, rinse in hot water containing lime, and finally leave the pails stand with water containing a tablespoonful of lime water until ready to use. The bacterial growths are minute and often a cow stands in a pool of water containing a slimy growth and brings them into the milk in that way; sometimes they seem to come from the air and develop in the crevices of the milk vessels. The formation can be checked by heating the milk to 90 degrees before setting it in pans in a cool place. It is sometimes checked by keeping the milk while setting a little warmer, say at sixty degrees all the time the cream is rising on it.—M. E. S.

Jersey-Holstein.

If figures are available I would like to know on an average which of the breeds, Jersey or Holstein, produces the most butterfat for feed consumed. —Subscriber.

This question is not to be answered as no figures are available. One may have an opinion founded on observation that the cows that can convert the most roughage into milk are valuable to the general dairyman while the man nearer sources of supply of concentrated foods will find the cow that requires that the most profitable. The fact is that if we look over the food consumed in making any of the official tests of the different breeds the amount fed is far above the dairyman's ration. Eighteen to thirty pounds of grain has been given as amount consumed. This feed has often been as high as two pounds of oil cake meal, say bean meal and fully half of the heaviest of the concentrates. The question must solve itself for the individual man by the question which feeds are cheapest for me? —M. E. S.

Palomino for Pollination.

I wish to ask through your columns whether M. E. S. considers Palomino better than Black Morocco to help pollination in the case of shy bearing. The Black Morocco is in bloom nearly all the time. I wish to try something in this line upon the Almeria grape and would be pleased to get all the information I can.—G. W. A., Stockton.

The question of using the Palomino grape as a pollenizer for the Muscat turns on the fact that both are white grapes and that the Palomino has a dry pollen that rises and spreads better in damp weather than the more waxy pollen of the Muscat. As to the Almeria I do not know that they need this pollination. In none of the standard works is the Morocco given as a free producer of dry pollen. It is the quality of the pollen that makes it valuable. I will pass this question up to my chief, Prof. Bioletti, for answer.—M. E. S.

Dogs.

Please give addresses of breders of cocker spaniels and collies. — Subscriber, Dinuba.

We are unable to give names of breeders of these dogs and will ask subscribers who know of them to inform us.

Pruning Emperors.

Please give method of pruning Emperor grape vines.—Subscriber, Ione.

I fear it will be too late to help you this season. Raise one or two of the canes to the top of a tall stake, one driven a foot into the ground and standing five feet above it. The two top leaders will reach that height probably. If they do not tie them up as high as they will go, cut back the other spurs and all the side laterals to two buds as nearly as possible. While we prefer only one trunk still many of the vines pruned as yours were in the early days have two and a few have three stems. At the top of the stake form a head for the vine and cut the spurs lower down each season to two buds, or sometimes to

one, but keep them going around the stake in a circle, not pointing out at angles. By always cutting the top bud pointing around in the right direction this result can be secured. The crown at the top of the stake is usually cut to three buds on the last season's growth and soon forms large clusters of spurs. The tendency of the lower spurs is to die back; when they do this we let them go though we prefer to hold them as long as possible, as they tend to check the enormous growing of the tops.—M. E. S.

Veterinary

Answers in this column by Dr. Fred G. Matthews, are without charge. For immediate mail answer remit $1.00. In writing questions give full symptoms or particulars of injury of animal.

Bladder Trouble.

My colt, in an effort to urinate, will lift one and then the other hind limb, and after a short delay, produce a fairly free flow of milk-white urine. Otherwise the colt is in good condition.—Subscriber, Livingston.

The color and turbidity of urine varies greatly in healthy horses depending upon the character of the food consumed—green foods increase turbidity and the urine may assume a sulphur-white color, due to the presence of lime salts. Retention of the urine in the bladder also favors precipitation of the solids. This colt evinces pain in the act of urinating, and doubtless retains the urine overtime to avoid the painful experience. Such a condition may result in the formation of stone in the bladder. Have some person experienced in manipulation of the bladder through the rectum to force out the urine and examine the empty bladder for stone. Wash the sheath and remove accumulated filth from the end of the external urinary organ, then oil the parts with sweet oil. Give gentian, saltpeter and belladonna in doses of two drachms each, three times daily for four days; skip four days and repeat.—F. G. M.

Swelling.

A swelling appeared under the jaw of my bull, extended down the neck to include the brisket and the under surface of the body. He became poor and died after lingering three or four weeks. Please give the disease and remedy.—Subscriber, Brawley.

In all probability the trouble here was caused by some pointed foreign body wandering through the flesh and interfering with the circulation. Occasionally a cactus thorn, sharp piece of wire or similar object lodges in the flesh near the base of the tongue or along the gullet and, should a large blood vessel be involved and obstructed by its progress, the swelling would be extensive. An examination of the body after death is the only means of learning the exact cause in such cases.—F. G. M.

Legal

Edw. L. Payne, attorney, 301-304 Douglas Building, Los Angeles, will answer legal queries in this department.

Immediate mail replies cannot be given except where fee to Mr. Payne is paid. When replies are wished in Cultivator address query to 115½ N. Broadway. Los Angeles.

Overflow Damage.

A ditch carrying winter flood water runs across the lands of A, B, C, D, and E. A in doing some grading takes down the left bank of ditch to such a degree that it will not contain the water when high, the water breaking over and flowing across the fields of B, C, D and E, causing damage. B, C, D and E call on C and offer to go with him and remedy the thing, but A refuses either to offer help or allow the others, B. C. D and E to go on his property and fix it themselves. What can be done? Ditch has been there from time immemorial. —Subscriber, San Luis Obispo.

A has no right to permit the flood waters to damage either of the others by diverting it from its natural channel, and either of them may bring an action against him for damages, and to restrain the turning of the water from its natural course.—E. L. P.

Lessor's Rights.

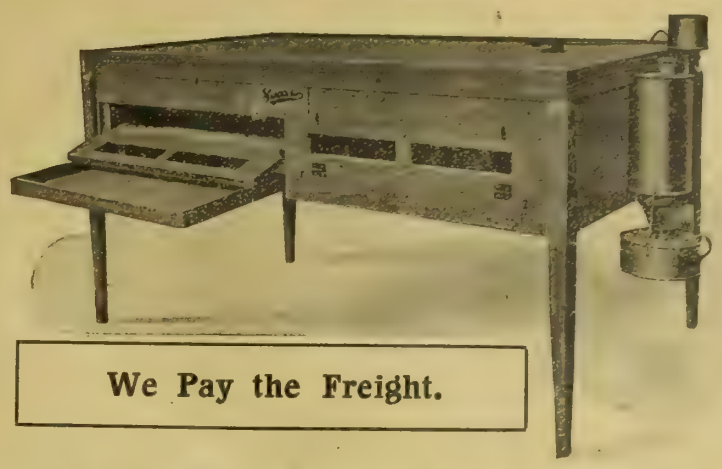
A owns a piece of land, B rents it for cash rent, B pays half down Oct. 26, 1910, and gets receipt. Now A sells it to C. Can C hold the grain or can B get the value of the crop from C in case C holds the crop, or can B make A pay him the crop's value?—Subscriber, Lindsay.

Growing crops pass with the title to the land and become the property of the purchaser of the land, unless reserved by the grantor. The purchaser of the land takes the same free from any lease made by the seller, unless the lease was a matter of record, or had been brought to the notice of the purchaser. The tenant, in case the purchaser is an innocent purchaser for value, having had no notice, by record or otherwise, of the lease, and in case the purchaser refuses to recognize the lease, has an action for damages against the landlord who has violated his lease and terminated the tenancy contrary to its terms, and the tenant may recover the rent paid as well as his damages.—E. L. P.

"Success" Incubators

Everybody Knows

THAT EVEN HEAT and the RIGHT amount of warmed fresh air is what hatches eggs. This can be had in a "SUCCESS" Incubator just the same as in any other well-made redwood case labeled Incubator. Don't think because some companies use a pretty label and a big price that you will get any more value than in the "SUCCESS" Incubator which I sell at these very low prices.



We Pay the Freight.

Buy from me at wholesale prices

Which would you rather do, buy from a company that sells through agents and tacks on 25% to the real value of the Incubator or buy from me at first cost? Any company that sells through an agent has to give them 25% to 35% of the price, or they would not sell the goods, that is plain. I do not sell through agents. I keep no books, sell to no one on credit, have no losses for you to have to stand a part. I sell to you at wholesale. My price list proves it. I sell a hot water, three-pipe system machine, double walls, double top, slatted egg trays, compound heater, complete with removable nursery drawers, stained mahogany color with three coats shellac, and then pay the freight on the machines. I can do it and still make a profit. I own my own buildings, pay no rent, use no high priced useless office help, and everybody works. If you are with me, get my free book today, 48 pages. It tells the story. Our 64-page Pioneer Hatchery book tells the story of the largest baby chick concern in the world. It's worth while. Send your name to me today.

——Experience

I can show you quick where we get it, when you get my book. My business doubles year after year, because I make good Incubators and sell at the right price.

We hatch 100,000 eggs every 21 days.

My heaters cost MORE

Than any other hot water heater used on any Incubator whatsoever. It has three pipes, hot water goes around the outside of the case first and returns through the central pipe. The copper boiler on the 612-egg size is 10 inches long; no other is made that long, and three pipes cost more than two. No hot air Incubator on earth will run as even as a first-class hot water Incubator.

60 Egg size, $9.00

130 Egg size, $14.00

360 Egg size, $25.00

612 Egg size, $40.00

WE PAY THE FREIGHT

INVESTIGATION is all I ask. Send for the book today

THE KT MOULDS

are the result of years of actual experience in the manufacture of concrete pipe or tile These moulds are the strongest on the market and the locks are so simple and easily operated that four men are able to make 560 feet of 10 in. pipe in 9 hrs. You cannot get such results from any other moulds on the market. Complete instructions for making pipe furnished free with order. These moulds are fully guaranteed. We also manufacture a complete line of irrigation appliances. Write for our "Brown Book."

The Kellar-Thomason Mfg. Co., 1222-1236 E 28th St., Los Angeles, Cal

Irrigation and Forestry

LIGHT BURNING.

A meeting of foresters and others interested in the preservation of timber and watersheds was held recently in San Francisco. A permanent fire protective organization was proposed. The object of this association would be to provide an efficient patrol of the state forests during the dry season by hired officials, preferably trained foresters, and to establish an available fire fighting force which could be operated economically in any portion of the state.

One of the most ardent champions of such an organization for California is D. P. Simons, a prominent lumberman of Washington, who makes his home in Los Gatos. Several such associations have recently been formed in Montana, Idaho, Washington and Oregon and the spread of these associations during the last four years is regarded as a good indication of their success.

In order to determine whether the so-called light burning method is applicable to conditions in the National forests of California and to find out its effect upon forest reproduction a thorough study has just been made by the forest service of the holdings of the Diamond Match Company, whose land adjoins the Lassen National Forest. The company has been light burning its land for a number of years, with the primary object of insuring the company's merchantable timber.

As a result of this investigation the U. S. forest service has announced that it could never adopt the light burning system as a method of fire protection. This system, it is claimed, does not aim at complete protection and does not attempt to protect the young forest growth. The young trees, many of them as high as thirty years old, are, according to the government experts, killed by the light burning and constitute a worse fire menace than before the land was burned over. Owing to the fires in question it is said that the chaparral and brush is encroaching on the forest growth in the company's holdings. The cost of the light burning operations, according to the government investigations, runs as high as 50 cents or more an acre. The government maintains that the forests cannot be maintained if the young growth is not preserved.

CARICA PAYAYA (Papaw).

The dried juice of the papaw fruit is at present one of the most appreciated medicinal substances. The actual demand for this article exceeds the production by 100 per cent and even more. This is most probably due to the fact that the papaw is nowhere cultivated on a large scale or rather that it has never been made the subject of special cultivation.

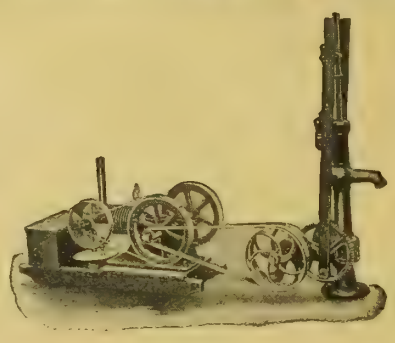
In the face of the usefulness of the papaw for medicinal purposes it seems strange that the chances offered by the cultivation of that plant have never been realized until now.

May be that the climatic conditions required by the papaw are answerable for the neglect on the part of agriculturists in tropical countries. A few drops of water are sufficient to spoil the juice of the papaw when in preparation for the market, a process which must take place in the open air, and as nearly all the tropical zones where the plant thrives are suffering from an over-abundance of rain, growers of papaws would be in constant fear of sustaining losses.

The country where the cultivation of the papaw would really be a lucrative industry is Peru, or rather the coast region of Peru, where rain is practically unknown.

The water needed for irrigation purposes is provided for by numberless rivers and rivulets descending from the nearby range of mountains, the Andes, as well as by artesian wells. Therefore, in the coast region of Peru, the juice of the papaw could not possibly be ruined by rain. In fact, this tract of land is an ideal place for the cultivation of this valuable fruit, and it can be pretended, without exaggeration, that no other enterprise can possibly offer more inducements and less risks to an eventual investor of small capital than a plantation of papaw.

The Little Gilson Air Cooled Gasoline Engine



Goes Like Sixty Strong Compact Neat

Every farmer needs a small engine. The Gilson "Goes Like Sixty," runs the domestic pump, cream separator, ice cream freezer, honey extractor and, in fact, can be used wherever an improved and more efficient method is demanded.

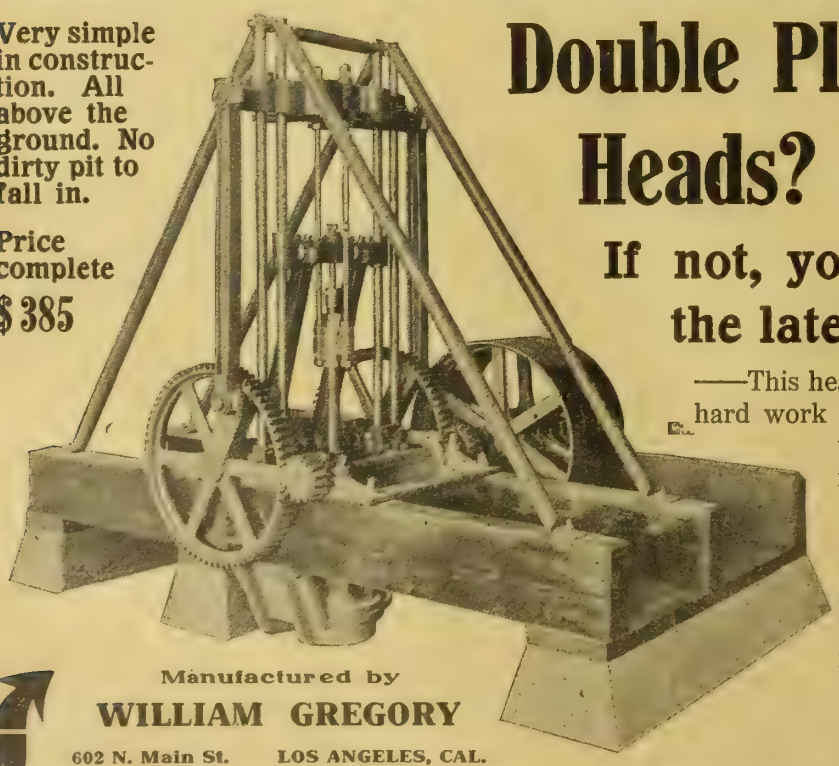
Have You Seen GREGORY'S Deep Well Double Plunger Power Heads?

Very simple in construction. All above the ground. No dirty pit to fall in.

Price complete $385



If not, you have not seen the latest in power heads

——This head is the production of years of hard work and careful study and is made to meet the demands of the California rancher.

Tight and loose pulley for belt. Heavy gearing, strong, durable.

This head is very reasonable in price to begin with, very smooth in operation, lifting water with the least power. No machinery to move in order to pull the rods.

Manufactured by

WILLIAM GREGORY

602 N. Main St. LOS ANGELES, CAL.

Timely Ranch Suggestions

WANTED—A PURE FABRIC LAW.

After a struggle covering seventeen years, we succeeded in securing a national pure food law. Since that time we are not obliged to eat maple syrup made out of glucose. We can at least be reasonably certain that the food we eat is what it pretends to be. It has driven a great many arrant scoundrels out of business; and while, like all other laws, it falls short in its execution, nevertheless a movement to repeal this law would drive every congressman who voted for its repeal out of office.

We are in about as great need of a pure fabric law as we were of a pure food law. The necessity for it is being urged in congress, and we hope it will be enacted before seventeen years pass by. We would like to know, for example, whether we are buying all wool, part cotton, or worse still, part shoddy. Many of our readers remember buying an overcoat, and, after wearing it a few years, seeing the good wife rip the lining from the bottom and shake out the shoddy that had collected. Now this shoddy is simply old, worn-out wool. It may be composed of the cast-off clouts of the Bedouins of the desert, or gathered up from the lazar houses of Europe, and ground up and put in the cloth to make it seem heavy.

Many years ago the shepherds of the plains of the Mississippi valley struck a bargain with the woolen manufacturers, the net result of which was that the shepherds were to have high duties on raw wool and the manufacturers high duties on foreign goods, and the same duty whether it was all wool or only part. The manufacturer at once began to substitute cotton and shoddy for part of the wool, because it was cheaper; and the sheep men innocently buy the adulterated goods. Ten years ago, according to the census report, the manufacturers of woolen and mixed goods used 75,000,000 pounds of cotton and 68,000,000 pounds of shoddy, and of course sold much of it for pure wool.

What is needed now is simply the requirement that the manufacturers shall be decently honest and brand their goods for what they are. If they are all wool, let them say so; if part cotton, say what per cent; if part shoddy, what proportion. Let the buyer know just what he is buying. This is honesty; anything short of it is fraud.

In this bargain of the sheep men with the protectionists the sheep men have got the worst end of it. They do get some little benefit, however, even if it was a wretchedly bad bargain; but the man who does not have any sheep is simply deceived and fleeced, and can not help himself unless congress passes a pure fabric law and compels cloth and clothing to be sold for what it is.

A really all-wool garment, unless imported, is one of the hardest things to find in the United States today; and when you do buy an imported garment you pay about twice the price for which you could purchase it on the other side. Two years ago, before we went to Great Britain, we went to a tailor and had an all-wool business suit made of imported goods, and it cost forty-five dollars. (The only objection we have to it is that we are afraid we shall not live long enough to wear it out.) We took this suit to a tailor in Belfast and one in Dublin, and asked what they could duplicate it for. The Belfast tailor offered to duplicate it for twenty dollars, and the Dublin man for twenty-two and a half. We could have bought a suit made of American goods that looked as good as the imported one for less than forty-five dollars; but it would have been worn out before this, because it would have been mixed with either cotton or shoddy. While over there we bought an overcoat for fifteen dollars that would have cost us at least forty dollars any place in the United States. This holds true, though perhaps not to the same extent, even across the line in Canada. As we were coming home through that country we got in touch with a high protectionist from New York in Montreal, who claimed to have made the expenses of the trip in the lower price he had paid for clothing he bought while there.

Our woolen interests no doubt need some protection, and should have it, but our plea now is that they be compelled to be honest and say whether their goods are made of all wool, or part wool; if part cotton, how much; and if part shoddy, how much. No business can permanently prosper unless it is conducted honestly; and our plea is for honesty, whether in selling food or clothing or grain or anything else. Let the people have a square deal.—Wallace's Farmer.

PLAY AND RECREATION THE SALVATION OF A NATION.

Play and recreation are as essential to the proper development of man as is work. Work alone with no allowance for unproductive effort, prevents the normal growth of the body and a sweet-spirited mental development. Real hard work is absolutely necessary to perform our function in this world, but work alone sours the individual. Proper alternatives of work and play make middle-aged people young and old people sympathetic with the children.

A nation's or a community's decay is in part shown by the absence of play at school, and games and pastimes at home. The father who makes cornstalk fiddles, little water wheels, whirligigs, spool tops, and hot-air paper spirals to hang over the old cook stove, is getting pretty close to the "happy corner" in the home; and the mother who plays "I Spy," and "Fly away Jack, Fly away Jill" with spool labels, and who assists with doll dressing and taffy pulling, helps to add to the word "mother" much that will make it a dearer word in the home.

The teacher who enters into the games at school makes his school a more potent factor for good citizenship. Character will be developed in truth telling, a respect for the rights of others, the performance of duty, and an obedience to the will of the many. No new-fangled nor greatly modified games are needed—just common, old-fashioned "two or three cornered cat," "fox and geese," prisoner's or dare base," and others requiring much action, that have been handed down for generations or perhaps for centuries.

Let us help to keep the old young and the young gay by prolonging the pleasures of youth as far as possible. Mind and body will be plastic and "thoughts of youth will be long, long thoughts."—A. B. G., in Ohio Ag. Col. Extension Bulletin.

"Let There be Light."

—PAT HENRY, before the battle of Bull Run.

We are not sure that our old friend Pat has been correctly quoted, neither do we know that he was anywhere near Bull Run during that memorial event, but we do know that every Rancher, Miner, Dairyman, Stableman and Teamster on the Pacific Coast should be in possession of at least one of our Vehicle Headlights, here illustrated.

There are times when a good, strong light is almost indispensable. It is needed around the barn, the thrasher, the harvester, on the gang-plow, on your wagon or buggy when driving over rough roads, the ranch, the mine or the dairy.

A Boesch Vehicle Headlight is worth a dozen ordinary hand lanterns. They are well made, strong and durable, each one is fitted with a highly polished silver plated parabolic reflector which concentrates the rays of light with remarkable brilliancy. The body is finished in a rich glossy black with polished brass trimmings, and for appearance it is first in order of handsome lamps. It embodies all our latest improvements, and for efficiency as a light producer it is without equal. This is the Headlight that caused the passing of the State Law prohibiting the hunting of wild ducks by artificial light. It is being used by nearly every Fire Department on the Coast and in many of the large Eastern cities.

Do not be led into buying a cheap, inferior lamp. It won't pay. This one is the result of forty-two years' experience in the business. It is home industry, and we guarantee satisfaction. It is made in 6, 8 and 12-inch sizes, measurements across the face.

We also manufacture many other styles of Headlights, Lamps, Lanterns, etc., too numerous to mention.

Write for Catalogue and full particulars of lamps or lanterns that you require.

FARM LANDS FOR SALE.

For Sale—By owner, good farm land, $50 per acre, in Merced County, 9 miles from Merced and ½ mile from station on S. P. and 4 miles from La Grande on Santa Fe. This land is a rich, sediment soil, situated in the Artesian Belt and an abundance of water is thus assured. Is level and all under cultivation. No alkali, and is suitable for figs, corn, alfalfa, beans, and all farm crops. Will subdivide in lots from 40 to 1000 acres. This land is very cheap at the price. In fact, it is only one-half the price of other land in same locality. For further particulars, call or address Paxton, 612 Lankershim Bldg., Los Angeles.

For Sale—No exchange—43½ acres near Baldwin Park, 17 miles east Los Angeles; good orange and walnut district; 20 acres now set to alfalfa, balance grain. New six-room California house, windmill, etc.; 40 shares good water stock, good roads, blvd. passes the ranch, close to electric and steam lines. Price $450 per acre; ½ cash. Joseph Coleman, owner, 108 E. 1st, Long Beach, Cal.

For Sale—$125 per acre, 160-acre ranch in Owens River Valley, 2 miles from county seat. 12 acres Stayman Winesap apples, 50 acres alfalfa, 60 acres farming, balance pasture. Entire ranch soil suitable for apples and pears or farming and alfalfa. 100 inches water continuous flow, non-assessable. Would consider one-half exchange in Southern California. Address Owner, Box 52, Independence, Cal.

24 Acres in the Famous "Orland Project," 18 acres alfalfa, 6 acres bearing oranges; all irrigated by the U. S. Government; Orland's best soil; small residence, barn, dairy-house, etc.; right in town, and will double in value in a short time; worth $12,000 now if cut into city lots. Will sell for $8,000 for a short time. Address owner, J. Vance Wilt, Box 71, Orland, Cal.

If You Want a Fine Home, No. 1, rich, level land, close to best market in the state, best climate, where irrigation is not required, write me. I have a few 80 and 160-acre tracts at $10 per acre. Also a fine 160-acre relinquishment for $500, if taken quickly. Wm. T. Mantz, Pattiway, Cal.

For Sale—A 20-acre farm for $20 cash and $20 a month; possession now; $90 to $125 per acre; your crops pay for the land. Rich, level land for alfalfa, oranges, almonds, grapes, cows, chickens; abundance of ditch water, for irrigation, for $1 an acre a year. Where else can you get this? In Oakdale Colony, near good town and railroad station, climate delightful. T. Wiesendanger, 207 S. Broadway, Los Angeles, Cal.

For Sale—815 acres in San Luis Obispo County. A typical dairy ranch. Plenty of wood, water, irrigable land, buildings, fenced and cross fenced. Orchards, vineyards, oranges, lemons and walnuts do exceedingly well here. Forty acres of land suitable for these. Price $21 per acre. For further particulars apply to Mrs. F. A. Clink, Pozo, Cal.

San Joaquin Valley alfalfa land for sale with railroads, schools, electric power and cheap water at hand. 40-acre tracts and up at reasonable prices. Also several large stock and alfalfa ranches with artesian water. C. H. Biggin, Pixley, Tulare Co., Cal.

Irrigated Land—The famous Gridley Colonies. Improved lands, best homeseekers' proposition in California. Write for particulars. Gridley Land Co., Gridley, Cal.

Cuba—Most productive soil. Delightful and healthful climate. Ample rainfall. Cheapest transportation facilities to the world's greatest markets. Particulars free. Sanderson, 13 Palace Building, Minneapolis.

For Sale—Near Lancaster, Cal., bargains in improved and unimproved land. Also relinquishments for sale or trade. Some homestead land. A. S. Burnham, Box 451, Lancaster, Cal.

Apple Orchards—Large and small, in the only apple producing section in California. The greatest section west of Missouri River. Write for booklet. Geo. W. Sill & Co., Watsonville, Cal.

DAIRY SUPPLIES.

Have You a Cow?—Have you a creamery? Have you a cheese factory? Write us. Everything used in either a dairy, creamery, cheese factory, or for handling milk, cream, butter, or cheese. WICK'S FOWL WHITE FARM, Moorpark, Cal

Business

BABY CHICKS.

The season is on for baby chicks. It's going to be a big season, too. You will want to place your order early so as to secure the number you require and of the quality you want. It is important that you give this matter prompt attention. There are a number of reliable chicken hatcheries advertising in the Cultivator and an examination of our columns will give you the best places to buy your stock. All of our advertisers are thoroughly reliable and you can depend on getting a square deal from any of them.

The demand for poultry and eggs is increasing steadily and bids fair to continue right along. You would do well to get in line for some of the good poultry and egg orders. You can add to your income by placing a few hundred chicks on your place, and with but little expense and trouble.

HAY DERRICK.

Now is the time to think about your haying facilities and consider the best method of stacking hay. Hand labor is expensive and slow. To leave hay unstacked is a waste; therefore the thoughtful farmer will search diligently for an improved method that he may stack his hay better and quicker.

In this connection we call special attention to the derrick made by the Schmeiser Manufacturing Company, of Davis, Cal. It is the most convenient and practical method we have ever seen for quickly transferring hay from the wagon to the stack. It can be carried from place to place and one man with it can do the work of four men with the old style pitch fork. Besides this use, it will be found constantly convenient on the farm, and once you have it, you would never be without it. It is economy to have this derrick, and those who are expecting to handle hay this coming season should get in touch with the manufacturer at once. A postal will bring full information. Special attention will be given to inquirers who mention the Cultivator.

IN THE MATTER OF SPRAY.

When you buy your spray you want the best on the market. An inferior spray will cost more than a better grade as you will have to use a greater quantity or spray a greater number of times. It is to your advantage to get the most reliable to be had.

The Ortho Lime-Sulphur Solution gives perfect satisfaction. It is carefully and scientifically compounded and put up in steel drums, so there can be no waste. This preparation is made by the California Spray Chemical Company of Watsonville. You would do well to write for their descriptive circular and learn the good points of this spray. A mention of the Cultivator in this connection will bring you an immediate reply.

FIRELESS BROODERS.

This is a modern and very successful invention. It does away with the danger of fire, gives the chicks sufficient warmth and insures a healthy, vigorous growth. Every chick raiser should have a fireless brooder. It will save time and money. The Ward Fireless Brooder, sold by the Coulson Poultry and Stock Food Company of Petaluma, has been found very successful. It is well built, strong and durable and will last indefinitely.

You can get a descriptive circular free with price quotations if you mention the California Cultivator. It would be a good plan to find out about the brooders.

BROODER STOVES.

This is the season when you should be thinking of your little chicks and preparing to keep them warm and comfortable. A brooder stove is of great benefit in the matter of heating and you cannot raise chicks unless you give them sufficient warmth.

Good stoves are made by H. F. Arenberg and the Hunter Brooder Stove Company, both of Petaluma. It will be worth your while to write for descriptive circular and prices. Mention the Cultivator.

ORCHARD HARNESS.

Everything has its place and certain kinds of harness are made for special purposes. The H. C. Shaw Company of Stockton makes a specialty of harness which is particularly suited for orchard and vineyard work. It is light, strong, well made and will give lasting service. The price is low, when you consider the quality, and those desiring a good harness should write for circular and prices. Mention the Cultivator and a catalogue will be forthcoming at once.

SWEET POTATO PLANTS.

Thousands—yes, millions—of sweet potato plants may be seen at the grounds of W. W. Burford at Glendale, Los Angeles county. He has nine varieties of regular sweet potato plants, besides yams in variety. All told, he can supply over a million and a half of plants for this season.

The Hurst Manufacturing Company makes a full line of sprayers, including man power, potato and orchard sprayers, barrel sprayers, two-wheel and four-wheel sprayers. Readers of this paper should certainly write to the Hurst Manufacturing Company, 1413 North Street, Canton, Ohio, for a copy of their sprayer catalog. They have also issued a very handsome Spraying Guide, giving new formulas, and upon request, they will send you free a copy of this most dependable guide. The spraying season will soon be here, and it is well not to wait, but to write at once.

Placer county growers will plant 10,000 fruit trees.

General Household Notes

FREDDY'S MISFORTUNE.

Freddy Simpson—he ain't never had a lickin' in his life;
Not even when he broke th' blade o' his pa's bran'-new knife,
An' cut th' parlor carpet, an' made gouges in th' floor,
An' whittled his in-nishuls, too, right on their big front door.
You see, his ma opposes any punishment like that—
Why, she just reasoned with him when he spoiled his pa's new hat.

Huh! Walter Perkins told him how his pa would take a switch
An' whip him so th' places for a day or so would itch!
An' I told Freddy Simpson 'bout th' lickin's that I get—
So hard sometimes I'd ruther stand up for my meals than set.
An' Oscar Jones an' Rufus an' Bob an' Freckles Smith,
They said they'd take th' lickin's rather than be reasoned with.
Us boys, we got to tellin' Freddy how th' whippin's feel,
An' how your pa whacks harder when you wriggle 'round an' squeal,
An' how you holler to him, "I won't do it any more!"
An' how you just don't do it, long as you keep feelin 'sore.
An' we got Freddy Simpson to believe it isn't fair
Fer his folks jest to reason—when th' reasons never scare.

So Freddy Simpson started out today to be real bad,
An' played some tricks at breakfast till his pa was awful mad
An' started out to reason—but Fred kept a-makin' noise,
An' said, "Why don't you lick me like the others does their boys?"
An' so his pa he licked him, an' now Freddy says his ma
Spent all th' mornin' reasonin' about it to his pa.

—Wilbur D. Nesbit, in Harper's Magazine.

LOVE THAT LASTS.

By Mabel Craft Deering.

The court room was crowded; the sickly odor of second-hand air fought with the mustiness of the damp stone corridor every time the swinging door opened. The prisoners filed into the cage-like dock, hand manacled to hand, and peered through the iron netting, like animals in the zoo, near feeding time. Only, instead of being splendid beasts, these animals were underfed, with misshapen heads—abortive attempts of tired nature to produce a man. The crisp-voiced little judge sentenced one after another, his carefully balanced periods received stoically, with dropped jaws and flabby lips, though once or twice the sound of weeping came from some woman in the crowded room. On these occasions the bailiff rapped sharply for silence.

The last man to be sentenced was a blind beggar. His face was pitted with smallpox, not a ray of light penetrated his sunken lids—calamity had wreaked her worst upon him. Small wonder that he cared neither for God nor man! Sometimes he crazed himself with alcohol and staggered along the street in his helpless blindness; sometimes he swore savagely when passersby jostled him, then whiningly offered for sale a package of English lavender. He had been up for numberless misdemeanors before, but this time it was something more serious—he had stolen something worth while. Other judges had been lenient with him—he seemed to owe so little to society that one could expect but little in return. This offense, however, could not be overlooked and he had just been sentenced to two years in the penitentiary. He took his doom quietly; it meant two years of plentiful food and warm housing.

Suddenly a spasm of feeling passed across his scarred and savage face. He stood up and felt his way to the iron screen that protected the dock, turning his sightless eyes to the courtroom. He could feel the warm breath of its fetid atmosphere against his face.

"I've got a dog," he said," clearing his voice, "a dog that will have no home unless somebody'll take it. It won't whine if it don't get its food reg'lar, and it don't object to a kick or two; it would feel kina lonesome without them, I guess"—this with the shadow of an evil smile. "It's lame" —he was raising his voice desperately above the shuffling of feet, for the crowd was filing out, "but it can lead all right, and sometimes (he swallowed a lump in his throat) when folks see it limp they feel sorry for it and throw me a nickel or a dime." He was shouting now because of the increasing noise in the courtroom. "It ain't no thoroughbred, but it's as good as a meal ticket, and it's a right good friend in need. Oh, won't somebody take my dog?"

The voice was a cry now, and the scarred face gradually humanized, while the judge remembered that man was made in the image of his God.

The beggar stopped suddenly, for the courtroom was empty. A deputy sheriff touched him on the shoulder, and he turned to go, cursing bitterly. A chair in the warmest corner of the courtroom, nearest the stove, grated as it was pushed back, and a thin-faced boy in a ragged suit stepped up to the screen and stared at the beggar.

"I'll take your dorg," he said.

The beggar gave the boy the number of his room, forgot to thank him, and went back to the county jail. The next day he crossed the bay to commence his term.

Two years of happiness pass like a dream. In prison the blind beggar missed some things which had given him physical satisfaction in the days of his freedom. He had had more to eat, and his meals had been more regular, but he had missed the whisky, he had longed for the smell of lavender, for which an occasional whiff of mignonette or sweet pea from the prison garden did not compensate, and, above all, he wanted his dog. Why had he not asked the name of the owner of the thin, boyish voice? Why had he not begged for an occasional line with news of his only friend? The boy, of course, did not even remember the blind man's name; perhaps he had tired of the dog and had turned it out for the pound man or to be a waif in the streets, to live from scrap heaps and to be kicked by others than those who had the right. When he thought of these things the scarred face darkened and the convict swore beneath his breath, while his heart hardened a little more in the only soft place left within it.

The doors of the state prison open every Monday morning, and a certain number of yellow-faced men, in cheap new suits and clumsily-made, creaking shoes, come out into the sunlight. Once in a great while there is a woman among them, but usually ten or a

ARE YOU ONE OF THEM?

There are multitudes of young people who are not in the public schools, but who look to the business college for the special educational training and finishing needed preparatory to lucrative business employment. Of such the major portion of a thousand enroll every year at the ISAACS-WOODBURY—the recognized leader since 1884.

We have abundant teaching force of the highest grade, clean and inviting rooms, with perfect light and ventilation—100 FEET ABOVE STREET NOISE AND DUST. Call, write, phone. New Catalogue—27th year.

Available Nitrogen

is *the* thing in practical fertilizing.

Nitrate of Soda

is the cheapest and most available form of Nitrogen for all crops.

"The Cost of Available Nitrate," Sent Free

It is worth dollars to you. In this book Prof. Voorhees shows how the American farmer could have saved $17,000,000 on the cost of nitrogen in 1909. Address

Dr. William S. Myers, Director of Propaganda 71 Nassau Street
No Branch Offices NEW YORK

dozen men shamble out during the day to make a new beginning in the world, with five dollars in their pockets and a prison record behind them.

The heavy stones of the prison gates are flanked by a rough rail fence, and along the fence every Monday morning is a straggling row of figures waiting for the weekly egress. It is a strange company that gathers there before the sun begins to wage his daily war upon the lichens of the gray stone wall. To prevent criminals from herding together, they are released one at a time during the day, and so the crowd of "rail-birds" comes early. There are mothers and sweethearts and wives—especially wives; sometimes a respectable-looking man comes to extend the right hand of fellowship to a blood-brother gone wrong; sometimes a sweet face under a poke bonnet is waiting to persuade some friendless one to enter a prisoners' home.

On this particular gray Monday morning, almost two years from the time when the blind man had made his first and last public speech, a thin, ragged boy sat on the rail fence, holding by a string a dog that limped. Dog and boy had crossed the bay on the first boat, and by and by others joined them. There were women with strong, severe faces—the expression that a hardened burglar, just released, called the "I-want-to-do-something-for-somebody" look; next to the boy with the dog was a little woman crying softly into a baby's neck, and beyond was an evil-faced Fagin come to win recruits for his business in the city, whose smoky mantle could be seen just beyond the blue bay; but the boy with the dog saw none of these. He was watching the big gates, and he started every time the iron door clanged; but the man for whom he waited did not come. Perhaps he had died, thought the boy to himself; perhaps he had lost his credits, as, on each stroke of the clock, as the hours passed, a prison-bleached convict emerged.

The little dog whimpered, licked his lame leg, and made a bed for himself in the dust. Twelve strokes chimed from the big prison clock that has kept tally of so much wretchedness. As the last stroke died away, the gates opened and a man came out. The doors of the prison locked like jaws behind him, and he stood helpless, turning his sightless eyes to right and left. Suddenly a dog threw itself against his knee with a whine of joy; it jumped up and licked his hand, and rubbed its rough yellow coat in an ecstasy against the man's trouser leg. The beggar cried like a baby as he rubbed the dog he had lamed in a drunken spree, and the boy with the thin face and the ragged coat-sleeve went up to the pair with the ghost of a smile on his lips.

"Here's yer dorg," he said, simply.

They sat in the baggage car together on the way to the city, since the conductor refused the dog a place in the passenger coach, and they found a room where no objection was raised to a blind beggar, a lame dog and a thin boy who wished to live together. One sells lavender, and one sells papers at morning and at night, and sometimes, when the day's earnings have been slender, the beggar sends the boy after beer, and, while he is gone, gives his own share of meat to the limping dog—ashamed to have his little partner know of his soft-heartedness. As for the boy, he shares his own portion right under the beggar's sightless eyes.

Sometimes a fierce pang of jealousy stabs the boy's heart at the dog's demonstration of fondness for the other, and sometimes, when the beggar finds the dog curled at his companion's feet, an ugly scowl still further disfigures the evil countenance, but the dog, uncannily wise, knows when to thrust a moist tongue into a hand and when to rub his head against an unfriendly sleeve. With the unconsciousness of a child, he binds them not only together, but to all the goodness in their world. He only knows that he loves them both.

What was the promise to the peacemakers—that they should see God?—Mabel Craft Deering, in Sunset Magazine.

AROUND THE KITCHEN.

The small brushes that can be bought for a trifle are a great help in the kitchen, as they are excellent for washing glassware having uneven surfaces, and the dirt can be removed much more quickly and effectively from potatoes, turnips and other such vegetables with a brush than simply by washing in water.

Add a little sugar to any bought stove polish and mix with soap suds, and to make the stove shine, add a few drops of turpentine and a little coffee, as the coffee will make the polish last much longer than when mixed in any other way. The best way to clean and brighten the oilcloth on the floor is to first wipe it up with a damp cloth and then go over it with sweet milk in which a little sugar is dissolved. Put a tablespoonful of white sugar in half a cup of milk and place on the back of the stove until the sugar is all melted, then it is ready to use when the floor is perfectly dry.

Here is an excellent recipe for pie crust for just one pie. Take one cup of chilled and sifted flour and chop two tablespoonfuls of cold lard through the flour and mix quickly with three tablespoonfuls of ice water and roll

Pioneer ROOFING

—best by every test

The Popularity of **Pioneer Roofing** is due to its **wearing** qualities. We want to go on record right here and now with the positive assertion that a "Pioneer Roof" will outlast **two** ordinary roofs. The first cost is little if any more than you would have to pay for roofing of inferior quality. And once a "Pioneer Roof" is on, there is no further cost. It requires no paint or repairs.

Pioneer Roofing is made in several weights; suitable for residences, hotels, outhouses, business blocks; anywhere that a sunproof, rainproof roof is required. Comes in handy rolls. Easy to lay. No special tools needed. Everything necessary will be found in the center of each roll, for which there is no extra charge.

Free Booklet and Samples

The mauufacturers of Pioneer Roofing have published a 32-page booklet, which is effectively illustrated. The booklet is both interesting and instructive. It tells how to lay roofing—and what weight or thickness of roofing is best suited to the various kinds of buildings. The booklet and samples of roofing will be mailed free upon request.

They write us bushels of letters telling how it saves work and worry. Sold on little payments. Write for fascinating Free Book today. All correspondence should be addressed to **1900 Washer Co.,** 193 Court St. **Binghamton, N. Y.** If you live in Canada, address Canadian 1900 Washer Co., 355 Yonge St., Toronto, Canada.

When writing to CULTIVATOR advertisers **BE SURE** to say where you saw their advertisement. It will cost you nothing and **MAY** do you some good.

out quickly and you will have a flaky, rich crust. To make good and quick icing, take as much powdered sugar as is needed, and add a little sweet milk at a time, stirring constantly until the icing is just right to spread on the cake, and when the mixture breaks it is ready for use, then it can be flavored and plenty of chopped nuts stirred in if wanted. A pinch of cream of tartar will make the white of an egg beat quicker, and when making a cake use half lard and half butter and the cake will be lighter and whiter.

To save steps, have a large tray placed near the sink and place the dishes on the tray as they are washed and dried, then they are ready to carry to the dining room or pantry. If the pantry floor and shelves are uncovered, keep them white and clean by scrubbing them with hot borax suds and use this suds for scouring the kitchen tables and floors, and they can be kept white with very little labor; and there is nothing better or daintier than uncovered shelves, tables and floors when they are kept nicely scrubbed. Fine dishes can be kept shining by washing them in borax water without soap, as soap spoils the polish and glaze on nice dishes, and the silver in everyday use can be kept bright and shining by washing through the borax water and then polishing with a piece of soft cloth or chamois leather.—M. A. H.

STAINS UNDER THE NAILS.

There are various preparations sold by manicures to remove stains under the finger nails. With careful laws, most of these can be relied upon; but if there is any doubt about a special preparation, substitute lemon juice.

As a stain remover it is excellent, and the woman who keeps half a lemon on the stationary washstand where she washes her hands rarely will have to blush for the unsightliness of her nails.

Oxalic acid is also good, but is injurious to some skins. It should be applied with a bit of cotton on the end of an orangewood stick. In using the lemon, the tips of the fingers can be rubbed into a section of it. Later, rinse well with clear water.

Stains on the sides of the fingers are quickly removed with a moist pumice stone. This is invaluable to get off the first blotches after preserving, painting or doing any disfiguring work. In cases where the skin under the nails has roughened, a little powdered pumice can be moistened with lemon juice and applied with an orangewood stick.

Never scrape away a stain; it roughens both cuticle and nail, and becomes a dirt catcher rather than dirt remover.

Soaking the tips of the fingers in olive oil will help to keep the skin about the nail in good condition.—Herald.

Hotel customs throughout the world are varied. A hotel in France is on wheels, and turns so that any room can be given sunlight. Regulations governing the length of bed-sheets have been made in certain states. Probably the most unique custom prevails in Tempe, a town in the Salt River Valley, Arizona. Here the proprietor refunds the hotel charges to all his patrons on any day the sun does not shine. At first this seems benevolent, but on looking into the matter we find that he has been called upon to remit to his guests only once in the last five years. Guaranteeing sunshine is an original feature.

Handy Tools for Unhandy Places

E. C. SIMMONS KEEN KUTTER TRADE MARK U.S.A.

A hard job is made easier by a handy tool. A man in a narrow trench digs more ditch with a well-balanced, properly-angled Keen Kutter shovel than he possibly could with one less perfectly fitted to its job.

KEEN KUTTER
Farming Tools

fit everyday farming conditions. In other words—whatever the purpose for which you need a hand farming tool—a "Keen Kutter" will fill it *best.*

Buy your forks, hoes, rakes, shovels, spades, garden forks, manure hooks, potato hooks, scythes, ditch tools and corn knives under the Keen Kutter trademark. It means absolute satisfaction, or money back.

Keen Kutter Drain Cleaners.
Blade one piece highest grade crucible steel, oil tempered, hardened and polished. Beveled for either pulling or pushing, six foot selected Northern ash handle. A very useful tool.

MEXICAN LAND

States of Sonora and Sinaloa

Tracts of all sizes at low prices.

We have several tracts of from 1000 acres up, at first cost. These would make ideal small colonies, for parties who contemplate co-operating in purchasing land in Mexico. They are fine soil, good water conditions, and close to the railroad. We can save you subdividers' costs and profits if you and your friends can handle one of these tracts. They are suitable for anything from general farming to fine fruit and vegetable raising.

Our Santa Teresa de La Concordia subdivision, near Hermosillo, the capital city of Sonora, is delta soil, and is watered by the flood water irrigation system, corn, bean, garbanzo, and cotton land, $5.00 and $10.00 per acre, easy terms, 160-acre tracts. Fine river bottom silt soil, in the State of Sinaloa, with gravity or shallow well water for irrigation. Prices in small tracts, $12.00 up an acre, according to location and improvements.

Arrange to join one of our excursions which we are sending down at frequent intervals. Write us for free illustrated booklets and bulletin of prices.

Extracted dark	6½
Beeswax, lb	24@30

Hay.

Scott, Magner & Miller say: Arrivals for the week ending today amount to 4,167 tons, as against 3,791 tons last week, and 2,350 tons the preceding week.

There is no doubt in the opinion of the trade but what large stocks of hay will have to be carried over into the next season, as it will be a physical impossibility to dispose of the large stocks on hand prior to the harvesting of the new crop. There has been practically no export demand, and coastwise shipments are very light.

Alfalfa is in large supply and more difficult to dispose of.

We quote the wholesale prices in round lots on today's market as follows, viz.:

Fancy wheat	13.00@13.50
No. 1 wheat or wh and oat	10.00@11.00
No. 2 wheat or wh and oat	9.00@10.00
Choice tame oat	10.00@11.00
Other tame oat	7.50@9.50
Wild oat	7.00@9.00
Stock hay	5.00@6.50
Alfalfa, ton	9.00@10.50
Straw	40@50

Grain.

Wheat, No. 1	1.32½@1.37½
Barley, fancy	1.13¾
Barley, good to choice	1.10@1.12½
Barley, poor to fair	1.07½@1.10
Oats, white	1.45@1.50
Rye, new crop	1.50@1.60
Alfalfa seed	18@20
Mustard, brown	4½
Millet	2¾
Flaxseed	5@5½
Broom corn seed, ton	23.50

Feed Stuff.

Alfalfa meal	17.00@18.00
Bran, ton	24.00@26.00
Feed cornmeal, ton	33.00@34.00
Cracked corn	33.00@34.00
Ground barley, ton	24.00@25.00
Rolled oats, ton	29.00@31.00
Middlings	32.00@35.00
Oil cake, ton	40.50@41.50
Cocoanut cake, ton	25.00@26.00
Mixed feed, ton	25.00@27.00
Shorts	25.00@26.00

Citrus Fruit Market

LOS ANGELES, March 1, 1911.

The prices on oranges are very sat-

isfactory. The shipments running close to the 200 mark means that the market is absorbing great quantities of fruit. This is aided partly by the shortage of apples and the fact that good grade oranges are being sold generally in the markets by the peck and half bushel at prices lower than the best apples. With the continuing of these conditions it is hoped this year's production will be absorbed at satisfactory prices. Icing has begun with many shipments, and decay is much less noticeable than a few weeks ago.

A slight lowering is noted on Mediterranean lemons, but Californias are holding fully up to earlier winter quotations. Picking is continuing in the groves, much of the winter fruit being shipped, while the late fall cuts are being held.

Shipments.

Total shipments of oranges to date since November 1, 11,455 cars, of lemons 1,478 cars, making a total of citrus fruits of 12,933 cars. To same date last year: Oranges 8,113, lemons 1,485, or a total of citrus fruits of 9,598 cars.

LOS ANGELES, Monday, Feb. 27.—Nine cars navels sold here today. Market more active—better feeling.

Oranges—Navels from California are selling very well when they are fancy. There is plenty of stock offered, and the market rules about steady. Boxes, navels, California fancy 96s, $2.50; 126s, $2.50; smaller sizes outside in rather a small way, $1.75@2.25; orchard run, $2.00@2.25.

TEETH OF THE HORSE.

The teeth of horses present many peculiarities. In the normal mouths the rows of molars slightly diverge from front to rear and the upper rows are a little wider than the lower rows. The crown surfaces or "tables" as they are properly known, are slanting; the upper rows slant inward and the lower rows outward.

These planes are thus in opposition, yet in perfect harmony, for by this arrangement they facilitate the lateral and semi-circular movement during mastication.

Now, in the wear of the teeth improper development, such as unequal hardness and incorrect position, cause the tables to become uneven, the slanting surface forming too much of an angle, thus giving rise to conditions known as "shear-like mouth" and "sharp mouth." Again, the teeth being of unequal hardness, some of them are worn down sooner than others, thus forming an uneven surface or "step-formed mouth."

Such conditions as these give rise to improper mastication, "dainty" eating, and dropping the food from the mouth, thus causing poor digestion, and loss of condition and general health. For example, it will be noticed that the animal is chewing slowly and cautiously, holding the head to one side as if in great pain. At times he will merely taste his food, or abstain from eating any at all, unless it be of the softest kind of food.

These symptoms are certain indications of bad teeth, and the animal should be attended to without delay. Under the direction of a veterinarian these sharp edges can be filed down, the long projections cut off, and in this way it is possible to again shape the tables into normal position, such as nature intended they should be. A little care and attention to the teeth will work wonders in keeping the horse in condition to do the work which he is intended to do.—Portland Oregonian.

GOOD PEACH GROUND.

Soil for peach growing should be a good warm, sandy loam type. It is a mistake to plant peach trees in soil containing too large a per cent of nitrogen. The trees grow vigorously but rarely yield enough fruit to more than pay the expense of production. —Exchange.

WORTH ITS WEIGHT IN GOLD.

The Clipper Lawn Mower is one which will kill all the weeds in your lawns. If you keep all the weeds cut so they do not go to seed, and cut your grass without breaking the small feeders of roots, the grass becomes thick and the weeds disappear. It is a fine mower and information about it, including a long line of letters of commendation, will be sent if subscribers will write Clipper Lawn Mower Co., Dixon, Illinois.

ESSEX CATALOGUE.

The annual catalogue of the Robert Essex Incubator Co., of Buffalo, N. Y., is a finely printed 64-page book filled with illustrations. Everything which has to do with the poultry business is catalogued. Of course the principal features have to do with the excellent incubators and brooders of the Essex Co.

APPLE POINTS.

A neat little booklet of 16 pages is "Apple Points," on the cover of which is the statement, "Virtue lies in application thereof. A few things for those who want to know." It is issued by the Lewiston, Clarkston Improvement Company of Clarkston, Wash. It is filled with well written matter upon the apple cultural conditions and possibilities of Washington and Idaho, which is near Lewiston.

FIX UP YOUR FENCE.

Now is a good time to repair your fence or put in a new one. A good wire fence will add beauty to your place besides giving you durability which will more than compensate for any additional cost you may pay.

The California Anchor Fence Company of Stockton makes a specialty of supplying wire fences of all kinds and it would be a good plan to get in touch with this company and see what it has to offer in the line of fencing suitable to your needs. Perhaps it can be of material aid to you, and we are sure you will secure full value for your money. Mention the Cultivator and you will receive prompt and courteous treatment.

Hop growers of the Sacramento valley met last week at Sacramento.

Before you buy a Cream Separator See and try a DE LAVAL

IS THERE ANY DOUBT IN YOUR MIND as to which cream separator will give you the most satisfactory service, and be the most economical for you to buy?

Here is a proposition that should interest you.

Ask our nearest agent to bring a DE LAVAL out to your house and set it up for you. (If you don't know the DE LAVAL agent drop us a line and we will give you his name and address.) Try out any other separator you wish alongside of it. Give them both a fair, honest trial. Then buy the machine that

Skims the cleanest
Turns the easiest
Is easiest to wash
Is best constructed

If there is any doubt in your mind when you make this test as to the comparative skimming of the two machines, take a sample of skim-milk from each separator and send it to your State Experiment Station. They will tell you which sample contains the most butterfat.

We sell thousands and thousands of cream separators every year upon just such tests.

We don't hesitate to ask you to make such a test because we know the DE LAVAL will skim cleaner and give you better service than any machine on the market. That's why we are perfectly willing to let you try it out alongside of any "would-be" competitive machine ever built. Our willingness to have you make such a test should mean more to you than volumes of printed claims.

Give your cows a square deal. Be fair to yourself. If there is any one farm machine that should be of the very best possible construction it is the cream separator. It is used oftener than any piece of farm machinery—730 times a year—and the very best machine that you can buy will be far the cheapest in the end. You have always heard the DE LAVAL spoken of as a high-grade machine. All DE LAVAL users are DE LAVAL "boosters," because it always "makes good."

DE LAVAL cream separators are made in all sizes and capacities, from a 135-lb. an hour machine that sells for $35 to a $1350-lb. machine that sells for $160.

DE LAVALS are made to run by hand, or can be furnished with attachments for operation by various kinds of power.

We have agents in almost every locality who will be glad to set the machine up for you and give you a free trial, and we have an arrangement with our agents whereby a purchaser, if he desires, may make a partial payment at time of purchase, and pay the balance on easy terms covering a period of twelve months.

If you are interested in the purchase of a cream separator, be sure to write for our new catalog which illustrates and describes in detail the features which have made the DE LAVAL the universal favorite among dairymen all over the world.

In writing please address your inquiry to the nearest De Laval office.

Sooner Or Later You Will Buy a DE LAVAL

98% of the World's Creameries Use

DE LAVAL

Cream Separators

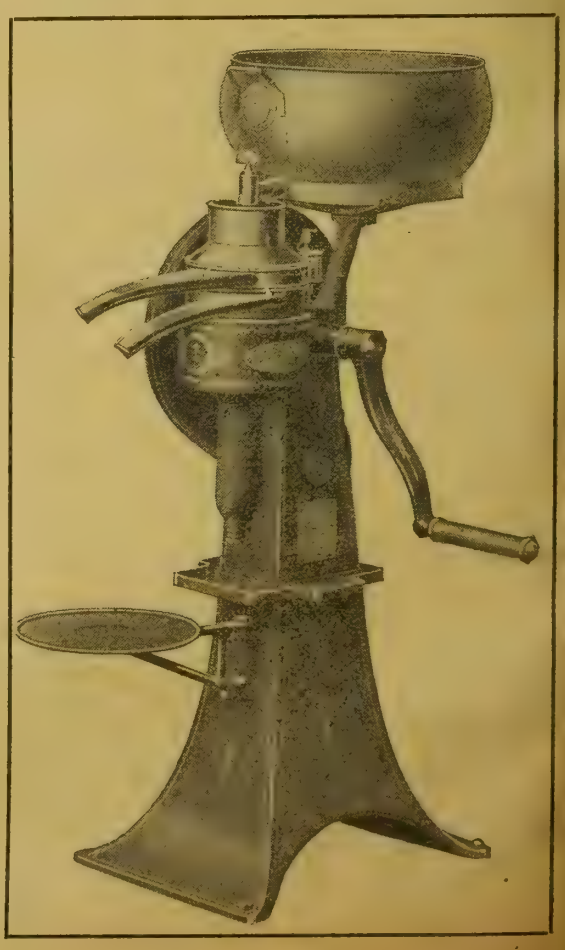
Ten years ago there were a dozen different makes of creamery or factory separators in use. Today over 98 per cent of the world's creameries use DE LAVAL separators exclusively.

It means a difference of several thousand dollars a year whether a DE LAVAL or some other make of separator is used in a creamery.

Exactly the same differences exist, on a smaller scale, in the use of farm separators. Owing to the fact, however, that most farm users do not keep as accurate records as the creamerymen, they do not appreciate just what the difference between a good and a poor separator means to them in dollars and cents. Nine times out of ten the farmer can't tell whether or not he is wasting $50 to $100 a year in quantity and quality of product through the use of an inferior cream separator.

Now, if you were in need of legal advice, you would go to a lawyer. If you were sick you would consult a doctor. If you had the toothache you would call on a dentist. Why? Because these men are all specialists in their line, and you rely upon their judgment and skill. When it comes to buying a separator why not profit by the experience of the creameryman? His experience qualifies him to advise you correctly. He knows which separator will give you the best service and be the most economical for you to buy. That's why 98 per cent of the world's creameries use the DE LAVAL exclusively.

There can be no better recommendation for the DE LAVAL than the fact that the men who make the separation of milk a business use the DE LAVAL to the practical exclusion of all other makes.



The Big Weekly { Fifty-two issues, each containing from 24 to 32 pages of practical information, } For $1 the Year

LOS ANGELES MARCH 9, 1911 SAN FRANCISCO

WATER BUFFALO IN THE PHILIPPINE ISLANDS.

WATER BUFFALO.

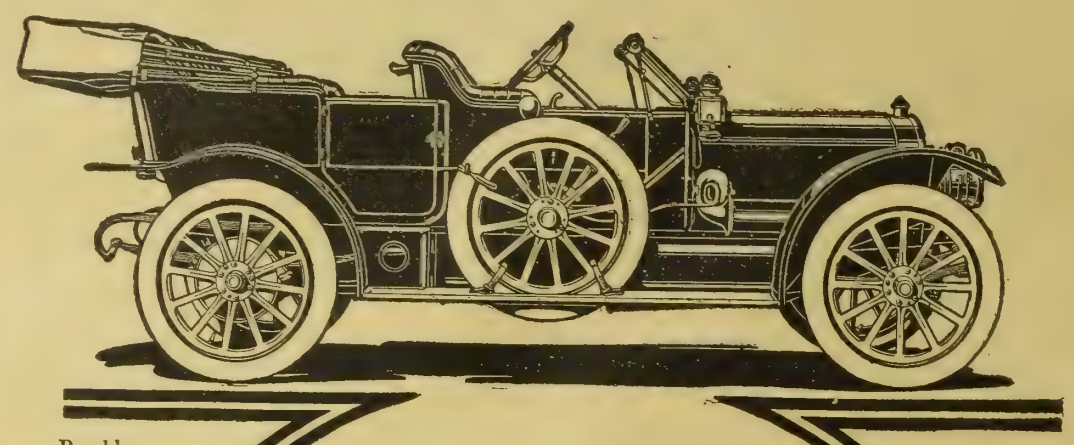
Probably the most valuable animal in the Philippines is the water buffalo, called on the island carabao, or, more technically and correctly, "bubalus bufalus." This animal is used for practically all the purposes for which a horse is used in this country, not only doing all the draft work on the plantations but carrying or drawing the family to the Sunday cock fights. It is immensely strong, being able to pull more than a horse, and in addition, is valued for its milk, flesh, horns and hide. From an American standpoint it has one serious failing, it demands repeated baths; an hour to two hours of steady work will exhaust it so that it must be allowed to go into a pool of water where, if not deep enough to cover it, it throws water over its body, and in the course of time is ready for another hour's work. In temper it is sometimes savage and gave some exciting experiences to strangers who came in with the American occupation. Ungainly and bulky as the brute is, its movements, especially when angry, are rapid, and inexperienced Americans attempting to handle it have furnished some laughable incidents and have sometimes been seriously injured.

In draft work the buffalos are attached to the load by traces connecting with a yoke of bent bamboo, the draft coming against the shoulders. They are controlled by a cord fastened to a ring in the nose or sometimes simply around the horns. In working the rice fields the animal is thoroughly at home and plods along through the flooded fields perfectly happy. During the last years of Spanish control these valuable animals were greatly reduced in numbers by surra, rinderpest and foot and mouth disease, and though the natives knew that they were dying with fearful rapidity, they took no steps to prevent the spread of these diseases. Since the American occupation intelligent study of these troubles has been made and great numbers of the animals introduced from China. The price ranges from 100 to 150 pesos, or from $50 to $75. Regarding the animal and its history Bailey's Cyclopedia says:

"The water buffalo is the largest of the bovidae, measuring, in the larger breeds, up to six and one-half feet in height at the shoulder, and ten feet in length from the muzzle to the base of the tail; body well rounded and large of girth; withers sharp and elevated; shoulders well formed; hind quarters less well developed; thighs thin; head comparatively small; muzzle large and carried well forward; limbs short and massive; horns large and much flattened, or somewhat triangular toward the base, deeply ringed, directed backward or downward, finally curving upward or inward and becoming scimiter shaped, usually very long, sometimes attaining the length of five to six feet; tail short, reaching to the hocks; skin a very dark bluish or grayish black, rarely brownish or grayish dingy white, thinly covered with coarse black hair; hair on the forehead and knees more dense; young calves well covered with brown hair all over. The color of the water buffalo is not unlike that of the elephant, and their motions are similar; the resemblance is so striking that a casual view of a moving herd of buffalos suggests a roving band of elephants.

"There is no doubt that the domestic breeds originated from the wild buffalo of India, but when domestication began, or at what periods these animals first appeared in the countries where they are now common, is doubtful. It is said that they were introduced into Italy in the sixth century and into Egypt some time prior to this period. They were in the Philippines when those islands were first visited by the Spaniards; further than this, little is known of their origin or history."

Rambler Motor Cars



Rambler
Sixty-four

IF you drive a Rambler the pleasure of motoring is not converted into drudgery by tire trouble, nor is the business of the farm interfered with by long delays on the road. The Rambler is the only American car equipped with the Spare Wheel. Fitted with a perfect inflated tire, it may be quickly and easily changed for a wheel with a damaged tire. No tiresome pumping in the hot sun or cold rain and you avoid the dirt so disagreeable to the well groomed. This eliminates worry about tire trouble which so often mars a trip. Every feature of the Rambler is designed for the owner's comfort, safety and convenience. The Offset Crank Shaft enables you to throttle down on high gear no faster than a man usually walks; to glide along quietly in crowded traffic without frequent gear shifting and obviates the necessity of rushing the hard pulls through sand and up grades. The Straight Line Drive saves power; big wheels and tires give added comfort and tire economy; the brakes are large enough to provide a feeling of security and the safety starting device protects you from injury while cranking. The Rambler is the standard car for the farm owner. Farm owners in every section of the United States have co-operated with us in the production of an unusual number of the Rambler Magazine.

Vol. XXXVI. No. 10. LOS ANGELES: THURSDAY, MARCH 9, 1911 One Dollar the Year

Twenty First Annual Session State Bee Keepers Assn.

A Well Attended Convention of Apiarists at Los Angeles. New Bee Inspection Bill Before State Legislators Endorsed. Co-operation Discussed And Many Practical Working Suggestions Made.

For the twenty-first time the bee keepers of California gathered in annual session in the Chamber of Commerce rooms in the city of Los Angeles on Monday evening, February 27th. President Burdick presided and Secretary Shaffner kept the records. The attendance at this opening session filled the hall to overflowing, and every session until the gavel fell at adjournment saw practically every chair in the room occupied. It was regarded the most successful session ever held by the organization. The greater number of delegates were from south of the Tehachapi, but representatives were present from the San Joaquin Valley and from the Northern California Bee Keepers Association.

The greater part of the program was given over to matters of apiary management, but the greatest interest centered on two other features, legislation and marketing. There was much discussion of the present apiary law and the amendments, which are being pressed by members of the association. Co-operative marketing was given an impetus which it is predicted will lead to definite action. A committee consisting of Messrs. J. W. Ferree of Newhall; M. H. Mendleson of Ventura, and Prof. Ralph H. Benton of the State Normal School at Los Angeles, was appointed to investigate as to the advisability of a co-operative movement and, if deemed advisable, to formulate a general plan of local organization, the same to be reported to the executive committee for more definite action.

Co-operation.

This step was taken following an address by Mr. J. B. Neff of Anaheim on co-operative marketing. Mr. Neff remarked that he had no fault to find with brokers and dealers personally; it was simply a question of securing the most money for his product without increasing the cost to the consumer. He felt it would be an error to create an organization which should assume to reduce production and boost prices. The manufacturer, the wholesaler, and the commission man joins his fellows in the same calling, and if no definite organization exists, a "gentlemen's understanding" prevails. The producer too often manifests his independence and insists on handling his own business, possibly to the detriment of his neighbor, and his neighbor to his. Especially in California where the producer has to look for markets at great distances, should there be an understanding to enable distribution of the product to the greatest advantage of the industry. Mr. Neff instanced the difference in prices to producer and to consumer of raisins, which in bulk cost the consumer eight to ten cents, while the grower receives two and a half to three. All dried fruits, and in fact, practically all products, show the same difference. One forceful illustration used by Mr. Neff was that given by one speaker in Congress, that a bushel of wheat which brings the farmer 90 cents and retails for $3.45 when made into bread at five cents a loaf, brings $37.50 when served in a good restaurant. Potatoes worth 30 cents a bushel in North Dakota served "hashed brown" bring an advance of 450 per cent. Honey is no exception. Of course the great success of the California Fruit Exchange was referred to and held up as an object lesson for the bee keepers. The Walnut Association and its successful handling of its business was also mentioned, but Mr. Neff granted that the walnut product was more easily handled under co-operation than would be probable in the case of the apiarists. One embarrassing feature for the honey organization is the fact that the production is not uniform; one year it may be as low as a million pounds and the next ten million, or in tons, vary from five hundred to five thousand. The average for the state is probably five million pounds at the average price of five cents to the producer. Mr. Neff entered into details of the formation of an organization, even to the detailed expense; for instance, on a 300-ton basis, or $30,000 worth of business, the association should not incur expense to exceed $3000. Of course, it is assumed that a greater tonnage could be handled if the organization is perfected.

Legislation.

In the matter of legislation Mr. Ferree reported for the legislative committee that the bill had been formulated and submitted to the executive committee; also to a committee appointed from other associations which do not affiliate with the state association. The bill had been placed in the hands of Assemblyman Lamb and had passed the Assembly, but was held up in the Senate because of dissatisfaction on the part of some northern apiarists. Mr. Richter from the State University, was present and represented the northern interests. The point at issue in the matter was the provision in the bill calling for the appointment of inspectors to enforce the law from a list to be furnished by the State Association. Some of the northern delegates present at the convention appreciated the situation and went to their northern homes with determination to aid in the passage of the bill as presented. It is probable that an effort will be made to extend the usefulness of the state association and make it representative of every section of the state. Any beekeeper may become a member upon payment of $1.00 dues and thus become a factor in controlling matters which are of vital interest to the entire industry. Upon this point the legislative committee consisting of Messrs. Ferree, Mendleson and Burton, submitted a report of the action of the committee and later formulated a statement for the agricultural committee of the Senate, from which we quote:

"We believe the bill to be framed in the interest of the whole bee keeping public of the state, and to be one vitally connected with the production and future development of the honey industry of California. The State Bee Keepers Association is a corporate body composed of honey producers from all parts of the state of California, and includes some in its membership whose bee keeping interests are wider even than the state of California. Anyone actually engaged in apiculture may become a member upon the payment of the required dues, and so far as we know in all its history of some twenty years, no honey producer has ever been denied the privileges of joining our association.

"With the growing alfalfa districts in some of the interior valleys, the bee keeping industry has greatly expanded in recent years. In some of these newer and remoter districts, as well as in the older bee keeping communities of the state, local district and county bee keepers associations have sprung up, such as the corporate body known as the Imperial Valley Bee Keepers Association, the Tulare County Bee Keepers Association, the California Central Coast Bee Keepers Association, and the Los Angeles and Orange County Bee Keepers Clubs. Many members of these avowedly local organizations are individually members of the State Bee Keepers Association, which in turn is in affiliation with the National Bee Keepers Association, an organization of some four or five thousand honey producers scattered all over America. Some of these local organizations are in affiliation directly with the national organization. Some of them are affiliated with our state association and send delegates to the annual convention. A year ago, at the request of certain of these district associations, notably the Northern California Bee Keepers Association, steps were taken to bring about a closer affiliation, and at that time certain amendments to our constitution were presented, looking toward closer identification between local bodies and the state association. These changes in our constitution have been passed upon at the recent convention of the state association, and now local associations may come into the state association as a body upon payment of small dues per member, less than the regular dues of membership in our association.

"We have put forth every effort to extend the influence and significance of organized effort among honey producers throughout our state, and our state association is destined, we believe, to grow and become more and more a channel of benefit representative of and in the interest of the whole bee keeping public of the state of California."

Black Brood.

The question of black brood and its possible control was discussed at some length. Louis Sinn of Reedley and Prof. Benton, who made extensive investigations in the black brood section, both made addresses along that line. Prof. Benton referred to the effort to establish a quarantine line which had failed because all counties did not unite. He questioned in any case the prevention by this means of its advance, which is at the rate of about 20 miles annually toward the south, because of the fact that in many sections swarms of wild bees are established so as to make a continuous line down the state.

The program as given in a recent Cultivator, was followed closely during the three-day session and many excellent addresses made. From these The Cultivator has a large number stored away which will give good things to the bee keeper readers for months to come. We regret that we cannot give more space to a number of them in this issue, but as a starter and an indication of what is to come we give the following which were selected by the executive committee as being particularly timely.

The officers were re-elected as follows: B. G. Burdick, Redlands, president; A. B. Shaffner, secretary. These two and J. W. Ferree of Newhall, M. H. Mendleson of Ventura and Ralph Benton constitute the executive committee.

BUILDING UP BEES FOR THE HONEY FLOW.

By J. W. Kalfus.

The first thing necessary to the successful building up of a colony of bees is to have a good queen. It does not pay to fool with a poor queen, and it has been my practice, of late, to commence the building up process by supplying a young queen the previous season. About the end of the honey flow I requeen one-half of my colonies each year, so by that method I do not have any queens in my apiary over two years old. Of course, there are some queens that will do good work in their third year, but generally speaking, I do not think it pays to keep them over two years. When I make my first examination of the bees in the spring, I pay particular attention to each queen, and when I find one that I am satisfied will not fill her hive with brood and keep it so, I pinch her head at once. If the

Citrus and Tropical Fruits

NEEDS OF THE CITRUS INDUSTRY.

At the recent banquet of the Los Angeles Chamber of Commerce, G. Harold Powell made an address in which he touched upon the magnitude and the needs of the citrus industry of the state. From report of his address in a daily paper we quote:

"At least $10,000,000 should be added to the net annual value of California orange and lemon crops as a result of the investigation into the insect pests and diseases and the hidden troubles that affect our groves. The average annual yield of our groves as a whole is low—not over one-third of a carload of fruit an acre. The yield of the better-cared for groves varies from two-thirds of a car to more than a carload an acre. The low yield is largely due to lack of understanding of the factors that enter into production and which can be solved only by a group of highly trained investigators working together.

Enormous Citrus Crop.

"Between 45,000 and 50,000 carloads of fruit will be shipped this year to all parts of the United States and Canada and to other countries. The revenue to the state will amount to $35,000,000 or $40,000,000, of which $15,000,000 to $17,000,000 will be paid for transportation. We take tremendous pride in the fact that California leads all other states in the union in the value of her petroleum products. We feel equally exalted in contemplating the rise of the citrus fruit industry.

"The crop this year will equal the total value of the petroleum products, and may exceed it by several million dollars during the present year. It will be as large as the total value of the wines, raisins and table grape crops, nearly twice as large as the values of the forest products, larger than the combined value of grain, grass and alfalfa crops, and three times the value of the dairy products of the state. California produces about one-eighth of the lemons and two-thirds of the world's supply of oranges."

Mr. Powell pointed out the difficulties met with in the citrus industry. He stated that California growers pay their labor two to four times as much as the labor is paid in the fruit producing countries of Europe. He further declared that it costs growers here three times as much to place their fruit before the consumer as it does the Italian and Spanish citrus fruit grower. Continuing, Mr. Powell said:

Tariff Is Necessary.

"In the face of this enormous competition, the higher cost of labor and of transportation, this $175,000,000 industry could not have developed, nor could it exist on a permanent basis if the government did not partially equalize the cost of production and of transportation by a tariff duty. The tariff gives us a fair chance to meet the foreign producer in our own markets. We must preserve the tariff duty, but we must depend mainly on our own efforts to forge ahead and win the future supremacy in the world's commerce of citrus fruits. We must adjust our differences, if we have any. We must raise the standard of the individual work of the grower, the packer, and of every one connected with the industry. We must adopt better agricultural methods. We must prevent the losses that occur from bad handling of the fruit. We must lower the cost of transportation. We must strengthen the bonds that hold our growers together. We must increase the consumption of our product and open new markets. We must gain an insight into the conditions of the industry in other countries. We must have regard for public opinion and play a square, open, business game. We must give a more practical meaning to the word 'corporation.'"

Mr. Powell spoke of the need of stronger agricultural institutions in California. He declared that California did not only need more investigation into the citrus industry, but the states should develop agricultural high schools, short courses and training schools that have a direct relation to the citrus industry. As an example of the work of an efficient organization in building up the agricultural resources of a state or country, he told of the Farmers' Co-operative Demonstration Work in the South.

Urges Citrus By-Products.

Mr. Powell stated that it is not unreasonable to expect that the American people can be led by skillful advertising and careful distribution to use twice the number of lemons that are consumed at the present time. He also pointed out that there is a big opportunity for developing a citrus by-product business of large proportion.

"We import from Italy," he said, "over a million dollars worth of citrate of lime, lemon oil and other by-products into which the low grades of fruit are converted. The efforts to develop the by-product business in California have so far not been successful. The crop has been too small and of too high grade to furnish a steady supply of low grade fruit. It has been impossible to do with the high-priced labor in California what the Italian industry with low-priced labor has accomplished. But the opportunity lies before us and as the industry grows larger the lower grades of fruit will need to be converted into oil, citric acid, lemon juice, marmalade, and other orange and lemon products. Some genius will yet devise mechanical methods of doing what the foreign hand labor now accomplishes."

ORANGES IN NORTHERN CALIFORNIA.

By J. W. Mills, Marysville.

The last two years have again fully demonstrated that the orange is perfectly at home in Northern and Central California. Last year was an exceptionally cold season, and this year, while we have had cold weather almost continually, no damage has occurred to even seed bed orange stock grown in the open garden with no protection whatever. In Marysville is a bougainvillea growing on the outside of an open porch, having made a growth of eight or nine feet last summer. Only a few inches of the tender growth is frosted. This indicates that we are in at least a citrus belt, though we fear that in most seasons spring would find the bougainvillea numbered among the failures. However, the fact that the winter of 1910-

11 was one of the coldest on record, and lemon and pomelo buds of the previous summer's growth went through without injury, and with no protection whatever, would indicate that we need not worry about the frost problem.

We are now speaking particularly of that part of the valley lying below the foothills and from 60 to 100 feet above sea level. Here, our ridge land is a deep sandy loam, a chocolate or red colored soil clear down to water, which lies from fifteen to eighteen feet below the surface. An unlimited supply can be obtained at 60 to 100 feet deep, which makes the water proposition a simple one.

The fact that we have the soil, climate and abundance of cheap water, coupled with early maturity of the fruit, gives orange culture a promising outlook for this part of the state. We know that our trees look well, that the fruit looks and tastes good, and we know that water and frost are the least of our troubles, while black scale is not able to withstand the dry summer heat. Black scale has been introduced here many times, but one season completely annihilated it. Orange culture is slowly coming with us, but some day we will be counted among the heavy producers.

Lemons will perhaps be grown in very limited areas, as the climate seems to tend to the maturing of the crop in the fall.

PARCELS POST VERSUS EXPRESS.

It certainly begins to look as if the express companies were coming in for their share of the attention which the public has been bestowing on the trusts and the railroads and the insurance companies and the rest of the big combinations. It was quite outside the possibilities that the magazines, in their search for more and more readable copy about "big business," would much longer neglect such a whopping big business as that which the express companies control. The attack has begun, and already the companies have been found guilty of making an awful lot of money. A writer in the current American Magazine gives some figures that would have looked impressive even in Brother Thomas W. Lawson's articles on "Frenzied Finance" and "The System."

It seems to be pretty clear, in point of fact, that the express business in this country has been extraordinarily profitable; that it has also been extraordinarily free from governmental regulation and supervision; and that it has likewise been extraordinarily free from government competition. In this last feature of the situation is probably to be found the main significance of the present increasing interest in the express companies' affairs. Be that as it may, the demand for the parcels post is certainly getting audible. Shippers generally are in favor of it. So are the department stores in the big cities, particularly the correspondence stores. So are a great many consumers, particularly those who live in small places or in the country. The retailers in the small places are opposed to it—naturally; and doubtless there are some other interests against it—including the express companies themselves. Evidently there is here enough material for another big politico-economic controversy. But the country can stand it. Democracy thrives on such divisions.—Harper's Weekly.

A good flow of water is being secured on lands in need of irrigation near Temecula, San Diego county.

"You May Send Me My 'NATIONAL' Style Book"

That is the message we are waiting for from ***you,*** that we may send you free ***your*** "NATIONAL" Style Book. That is what ***your*** book is waiting for—only a word of welcome and your name and address.

Copyright, 1911, by National Cloak and Suit Co.

What this "NATIONAL" Style Book Means to You

We have reserved one Style Book for every reader of this publication because it is the most interesting fashion book ever published—and also because we know ***you*** will be delighted with your copy.

It shows 224 pages of the new styles—and all are offered at "NATIONAL" prices. It illustrates and describes "NATIONAL" Tailored Suits, made to measure, $15 to $40.

You can make your selection from all the new suit models and have a suit designed, cut, made, trimmed and lined to your special order—actually and in every detail made to measure for you.

But even more than this. You have unlimited choice of over 300 materials. And now comes the wonderful part—we guarantee the finished suit to fit you and please you perfectly—we absolutely guarantee your complete satisfaction, or we will refund your money **cheerfully,** and pay express charges both ways.

In writing for your Style Book, be sure to state whether you wish samples for these "NATIONAL" Made-to-Measure Tailored Suits. Samples are sent gladly, but only when asked for.

And what shall we say of the new "NATIONAL" Waists—the most charming collection ever gathered together—and "NATIONAL" Skirts, America's best and most stylish. Let us give you a brief index of the magnificent showing of the new styles:

Waists . 98 cents to $8.98	Hats . . $1.98 to $14.98
Skirts . . $3.98 to $14.98	Misses' Wash Dresses and Misses' Tub Suits, $2.98 to $9.98
Lingerie Dresses . $4.98 to $19.98	
Wash Dresses, $3.98 to $8.98	Misses' Tailor-Made Suits, $9.98 to $17.98
Silk Dresses, $11.98 to $22.50	

In fact, nearly everything for Women, Misses and Children is beautifully illustrated in the "NATIONAL" Style Book we have reserved for you, to be sent you free if you write for it.

The "NATIONAL" Policy

The "NATIONAL" prepays expressage and postage to all parts of the world. You may return, at our expense, any "NATIONAL" garment not satisfactory to you, and we will refund your money.

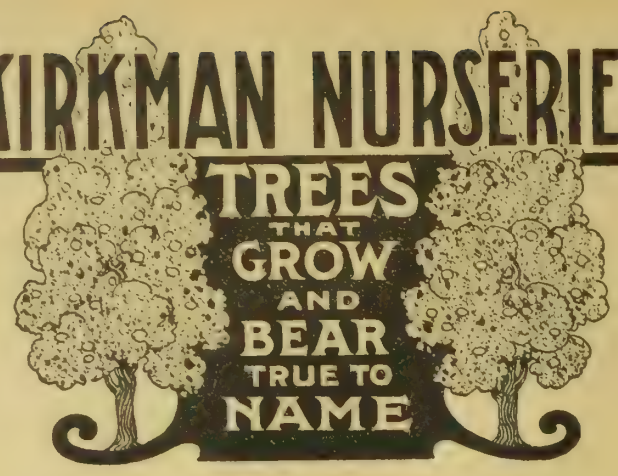
KIRKMAN NURSERIES



We are wholesale growers of deciduous and citrus fruit trees, grape vines and eucalyptus trees.

Our stock this season includes 650,000 deciduous fruit trees alone. A large lot of these are on Eastern seedling root, which has proven to be almost proof against root knot.

Get the best stock available and at the most reasonable cost from a man who selects the buds and scions of the best strains.

Deliveries made from our sales yards at Fresno, Madera, Merced, Turlock, Banning and Chico.

Write for quotations on your order. Address Main Office, Fresno, Calif.

Fertilize With AIR

The success of the experiments of Dr. G. H. Earp-Thomas in the commercial culture, preservation and application of "nitrogen bacteria" is proven by the use of

FARMOGERM

This is the long sought, practical solution of the problem of inoculating legumes for adding nitrogen to the soil at a trivial expense.

It is a wonderful and interesting application of science to agriculture that is making millions for the farmers of the country.

We are agents for California. Write us for literature.

Deciduous Bush-Tree Fruits

SHIP BETTER FRUIT.

Financial loss because of shipment of inferior fruit, fresh, canned and cured, should be and is an incentive toward a better practice. The fresh fruit shippers of the north have learned the lesson, and profited much by it last season. The citrus growers of the south have learned it most fully, and have profited by it for several years. The cured fruit people are not necessarily slower, but the lesson has not been brought home to them so forcibly.

The following indicates that one little section of Europe has occasion to kick about dried fruits. It is plain enough that the wayfaring man should profit by it.

The first letter is from the commercial body at Amsterdam, or, to be more exact, it is from the "Head Direction" of the "Nederlandsche Vereeniging voor den handel in Gedroogde Zuidruchten en aanverwante Artikelen." It is to the consul of the Netherlands at San Francisco, and is as follows:

"The Head-Direction of our association takes herewith the liberty to address itself to you in regard to the following: Every year at the beginning of the season, on our markets of Amsterdam and Rotterdam, the points in question, or differences, are raised as to what is to be understood by the various qualities of apricots, prunes and other California dried fruits. This difficulty presents itself as well with the shipments of exporters of your district as with the transactions between importers here in these kinds of goods. These differences could greatly be overcome if certain conditions or stipulations were made uniform as to what should in fact be delivered and accepted.

"For the above reason our Directors would be pleased to hear from you if there exists perhaps in your city an association which would undertake the task to furnish us the different 'type-samples' of the first fruits of the season as they appear on the market, and to forward samples to, and for account of, this association, and packed in such a way that said samples would keep their condition for a month or two. As soon as the regular shipments would arrive here, samples could be taken therefrom and compared with the 'type-samples' in our possession."

This letter, with the following, was sent to State Horticultural Commissioner J. W. Jeffrey, and by him presented to the last State Fruit Growers Convention as an inducement for further standardization. The consul wrote Mr. Jeffrey:

"I appeal to you for suggestions as to how to proceed in a matter that is very important to the fruit industry of California. The Netherland importers of California dried fruits suffer so often losses by the delivery of inferior goods when the purchase called for the first quality that they have formed a protective association in the hope to save themselves from future losses of the same kind. This association asks me to make inquiry if there is any authority or commercial body in California that can secure the standardizing of exported dried fruits. If there is not, this trade is liable with time to be diverted to other similar fruit-producing countries, such as Brazil and Argentine, and others where the experience of European importers is as favorable as that with California has been often unhappy and disappointing. As my government has called this matter to my attention, it is evident that it may decide to take measures for the protection of its home and colonial importers and people against the losses that arise from these causes. Some firms have lost so heavily as to disincline them to try further importations."

From Mr. Jeffrey's letter to California dried fruit producers we quote:

"The situation that at present confronts us is the threatened loss to our dried fruit producers of many of the best European markets, and this is due solely to the lack of standard qualities in the dried fruits handled by our exporters. The failure of California to authentically grade and sample fruits to the European trade is turning the attention of that trade to other districts, such as Argentina and Brazil. There is really no time to lose, for they have formed, in these commercial centers, protective associations to put an end to the abuses in the dried fruit exportations from this state. These consumers have no desire to boycott our products, but would prefer to buy from their old sources of supply. The Netherland importers of American dried fruits claim that they have sustained all the losses they care to submit to, and, through the Netherland Association for the Commerce of Dried Fruits, propose to protect themselves. I have been asked by this association if there is any way by which they 'can secure the standardization of California exported prunes, peaches, apricots and other dried fruits.'

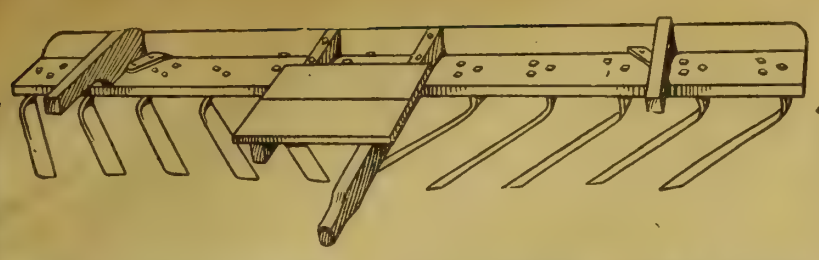
"As the need for improvement in our domestic dried fruit trade is equally imperative, the subject becomes so great that it cannot be handled without the aid of all the producers and shippers of these products joining in a wide movement to rectify the evils complained of by the consumers. I am, therefore, writing you asking that a concerted movement be started among all interested in dried fruits that shall place the trade upon a safer and more profitable basis. If the conditions and stipulations under which our fruit goes out are uniform, a great improvement is sure to follow."

BARREN HILL NURSERY.

Errors will happen and we regret them and resolve to reduce them in the future. Regarding one in the issue of March 2d, Mr. G. W. Phelps of Los Angeles writes:

In your issue of the 2nd inst. in "The Life History of a Great Walnut Tree" you say: "The nuts were obtained from France by the late Felix Gillett, the Baron Hill nurseryman of Nevada."

There are but two errors in this as far as I know. Felix Gillett was the Barren Hill nurseryman of Nevada county, California. With this correction I might safely close this note, but a sincere admiration for the men who have assisted in making California what it is horticulturally, begets the desire to see them get all the credit due them, for too often that is about all they receive for their years of labor and experimentation. It was "Barren" Hill in reality on which Mr.



THE KILLEFER CYCLONE WEEDER

We have Killefer Cyclone Weeders of all sizes on hand. This is a most effective tool for keeping down the growth of weeds after rains or irrigating on orchard, beet, bean or grain land. Guaranteed to do twice the work with the same team of any other tool. As the knives overlap each other, it is impossible to leave anything in their course.

Built in 6, 8, 10 and 12-foot sizes. Blades can be attached to cut in or out as desired.

OUR MONARCH CULTIVATOR

While designed more especially for field use, is now becoming a favorite among orchardists where deep cultivation is desired.

This is the strongest chisel tooth cultivator on the market, and we guarantee it to give absolute satisfaction. We make special hard steel chisel points that will outwear all others. This is a good cultivator for bean or beet culture.

OUR JUMBO SUBSOIL PLOW

Our "Jumbo" is built for deep, heavy work. Shin point and land slide are made of hard steel, and the entire construction is designed to stand all kinds of hard usage. You cannot buy a better tool for breaking subsoil hardpan in orchards.

We have made a careful study of the requirements along this line and know from actual experience that this plow will do the work that is required of it.

WRITE OR CALL ON US DIRECT

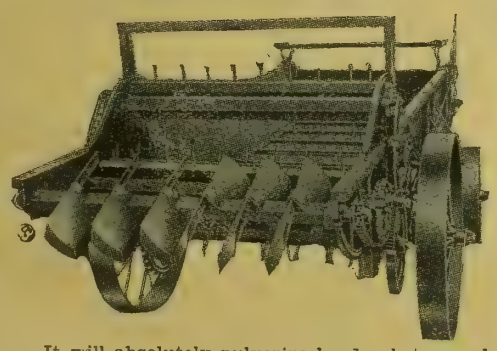
THE NEW IDEA



Just the thing that every farmer and orchardist has been looking for for years—a real Manure Spreader—not simply an unloader. That is why the

New Idea Spreader

takes the lead.

Why? Because:

It will absolutely pulverize hard substances better. Gives wider and evener spreading of any class of fertilizer. Less weight. Lighter draft. Absolutely gearless, no cogs or bevel gears. Its simplicity insures less breakage. Low down and easy to load. Only perfect endless conveyor that cannot race or slip, and needs no cranking back for re-loading. Better construction and longer life. Strongest wheels, both front and rear tracking with standard wagons. Load evenly carried on both axles. Double cylinders with Pointed Teeth, preventing choking and bunching, and the Widest Range of Feed.

Our new contract with the factory now enables us to make a GREATLY REDUCED price on this POPULAR SPREADER.

Illustrated and descriptive catalog on request. Demonstrations to responsible parties.

Western Implement Co., Sole Agents

ARNOTT HARNESS $10.00 to $80.00
Everything guaranteed. Money back if not satisfactory. Factory in Los Angeles. California leather for all uses. Send for No. 10, eighty page FREE Catalogue.
ARNOTT & COMPANY 112–118 So. Los Angeles St. Los Angeles, Calif.

Gillett conducted his experiments—a piece of land hydraulicked to the bedrock in one of the oldest mining camps in the state—one as hallowed in loving memories and the romance of early American occupation as was any corner of the wide expanses covered by the truly saintly Junipero Serra, rich in the Spanish-American romance of an earlier period—Grass Valley.

Anxious to learn something of the advanced culture of the walnut, years ago, I made a trip to see Mr. Gillett and the Barren Hill nursery. It was a visit I remember with much pleasure, and one that left a lasting impression which is my only excuse for asking a correction.

GOVERNMENT REGULATES FRUIT PRODUCTION.

The Greek currant is really a small grape. It has been grown in Greece since earliest times, and since the failure of the French vineyards in 1880 it is an important commercial product. The history of this business gives one of the most striking illustrations of an attempt by government to regulate a private industry. Under the stimulus of high prices the Greeks planted heavily and glutted the market. Strange to say little effort was made to increase the demand for the fruit. The government came in with an effort to cut off production. It forced each exporter to deposit in the government stores 10 to 15 per cent of exports. These were sold by the government for wine making. When the money from these sales reached a considerable figure the growers demanded their share. A currant bank was established in 1889, with a capital of $750,000, required by law to make loans in money or its equivalent in sulphur. Growers accepted this plan and increased production to 180,000 tons. The 15 per cent retention was raised to 20 per cent, but even this proved insufficient to control and keep up prices. Then the Greek government arranged with the currant bank to guarantee growers a fixed minimum price for currants. A loan was made to finance this scheme. This guaranteed price proved higher than the market price. The growers got the money and the bank had the fruit—and a loss of $400,000. Then they raised the retention amount to 35 per cent.

In 1905 "The Privileged Company" was organized with a 20-year charter. This company may retain 35 per cent of the crop, a heavy tax on new areas put in currants and control of tariff and taxes on grapes. It is to guarantee fixed prices for currants. For concessions it has the right to collect $2.60 a ton on all currants raised, and it may have about 60 per cent of all the currants retained for its own use. There have been two great crops in succession which have nearly swamped this company. In 1910 a law was passed which aims to induce growers to pull out part of their vineyards. They are paid a fixed price for each quarter acre uprooted.

All this will seem like a curious way to do business in this country, where the tendency is to increase production and keep on planting. Imagine Oregon or Washington passing laws to induce apple growers to cut down their orchards so as to shut off the output. The tendency here is to get out and find new markets for the goods. All these efforts to establish prices by law by trying to control production are likely to break down. No doubt the world would consume twice the volume of Greek currants if the Greeks would start a campaign like that of the Apple Consumers' League.—Rural New Yorker.

Garden and Field Crops

SMALL FRUITS BETWEEN ROWS.

By Q. A. Lobingier.

Is it wise to plant strawberries or other small fruits in the young growing orchard? If it is done, how should the soil be handled so as to keep in good condition for the trees? Is the use of the quantity of irrigation water required in growing small fruits detrimental to the young growing orchard? These questions were submitted to Mr. Lobingier and he answers:

Within certain limits it is entirely safe to plant strawberries and other small fruits in a young orchard. I think, however, I should bar out the blackberry. I have seen a single row of blackberries between young orange trees, the latter 24 feet between rows, rob the trees so that they were years in recovering their accustomed vigor and strength. The mistake almost invariably made is in planting too close to the trees. The small fruits remain from two to three years and no calculation is made for the expansion of the trees, with the result that often in a single season there is not sufficient room left between the small fruits for cultivation. This is the more important because of the fact that the cultivation can only be done the one way and is therefore more difficult, and if room has not been allowed for this cultivation, it becomes almost impossible to do it properly. It has been suggested that a row or two of the small fruits might be destroyed as the trees expand, but the average man will not do this.

If plenty of room has been allowed, the handling of the soil should be, so far as the trees are concerned, simply as if the small fruits were not there and you meant to cultivate your orchard the one way only. For young growing trees the amount of water needed for the small fruits will be no detriment. For bearing trees, however, it is quite another matter, as it is possible to greatly injure the quality of the fruit by too much water. Some years ago I knew of strawberries being grown between peach trees in San Diego county. Both crops were fair to look upon, but the peaches would not bear handling to the station, the juice literally ran out through the boxes.

I never advise this plan of growing in orchard small fruits if it is possible to avoid it. It will prove more satisfactory to grow each by itself, and a whole lot easier done.

But there are hundreds of cases where one's whole possession is planted to orchard and it is necessary to have some income from the land before the orchard comes into bearing. In such cases the next best thing for the orchard is to be liberal in the allowance of land for cultivation next to the trees.

FERTILIZATION OF STRAWBERRIES.

One of the heaviest crops of strawberries I ever knew raised was grown on land that had been stuffed with barnyard manure, a heavy coat again being applied just before the plants were set in the spring. There is another side to the story, however. The plants overran everything so that where the fruit was not picked every day there was heavy loss from soft or rotten fruit.

I am afraid, too, that the destruction of plants by the larvae of the May beetle, or "grub worm," is greatly increased by the use of barnyard manure, even though it is applied green in winter. Certain it is I lost a fourth of one fine bed last fall, the sandy part of the bed being absolutely full of these pests, though on heavy soil they seldom trouble.

We have to manure strawberries heavily, and the question is how to avoid the worms and also injury due to the great increase of weeds and soft fruit due to the application of fertilizers applied the spring the plants are to bear.

I have found three methods highly successful. One is to manure heavily and cultivate to other crops any land that is to be used for strawberries. This should be done for two, or better, three successive years previous to setting. One of our most successful growers raised onions on strawberry ground. Sometimes he sets the plants so far apart between rows as to raise a crop of opions between the strawberry plants. I always apply at least 800 pounds of high-grade potato fertilizer per acre on land that has been thus cropped, no other manure being applied the year the strawberry plants are set. I always harrow in the fertilizer after the ground is plowed.

I think the best method, however, is to plow under a good coat of hen manure in the spring, then harrow in the fertilizer. Sward ground must be cultivated to other crops one year at least before it is fit for strawberries in any case.

Another favorite method for very hot, dry soil is to apply a heavy coat of meadow muck instead of the hen manure. The muck should be got out the year before so as to allow frost to sweeten it. After plowing it in deep a good coat of fertilizer such as mentioned above should be applied. I never grew better vines and seldom better fruit than that raised on land spread with muck. I do this simply because I cannot raise early berries on heavy soil nor grass on light soil.

Thus far I cannot see any good but lots of harm in the application of nitrogenous fertilizers the spring the plants are to fruit. Last year I used nitrate of soda at the rate of 100 pounds per acre, applied in May. I got an immense crop of sorrel, lots of strawberry vines and fruit soft enough to suck through a quill. When I have tried ordinary fertilizers in the spring they were, I think, just throwi away.—Green's Fruit Grower.

EVE WOULD NOT REPENT.

What do California melon growers think of this? It was written by an admirer of "down South." Plainly, he never ate California melons:

"The true Southern watermelon is a boon apart, and not to be mentioned with commoner things. It is chief of this world's luxuries, king by grace of God over all the fruits of the earth. When one has tasted it he knows what the angels eat. It was not a Southern watermelon that Eve took. We know it because she repented."

The Tulare county horticultural commission war has been declared ended, and the bills as presented by Commissioner Schulz ordered paid.

Home Grounds Beautiful

PRESERVE CALIFORNIA TREES.

Professor Jepson in "Trees of California," says:

"The landscape as a whole is a valuable asset and should be made especially safe from spoliation within park boundaries. Even beyond park boundaries heedless and needless marring of the scenery ought not to be permitted. Of course agriculture, manufacture and the like must inevitably modify landscapes. In some cases it is, however, quite possible to mitigate the destructive effects of civilized occupation and yet not interfere with the orderly progress of our civilization.

"An illustration may be given to show one way in which the original character of the landscape may in great part be preserved. The beauty of the interior and some coast valleys is very laregly due to the presence of the scattered groves of the valley or weeping oak. These splendid trees give the valley floors a distinction which is entirely lacking to them when the oaks are cut away to make room for orchards and gardens. It is however, quite possible to offset largely the effects of this removal by using the valley oak on the main and cross roads as a roadside tree, particularly by planting at irregular intervals. A few owners of roadside frontage have made such plantings and there must be numerous others, permanent land owners, who at nominal expense would be glad to help restore, where destroyed, the park-like beauty of the California valleys."

PRUNING ORNAMENTAL TREES.

Of all the injuries from which trees suffer, the best authorities say that improper pruning is the most disastrous.

There are many species (such as the oak, which need practically no prunning or trimming except the removal of dead wood. Generally speaking, coniferous and broad-leaved evergreens, such as the magnolia and pittosporum, should never be trimmed, nor ornamental evergreen shrubs. Strictly ornamental trees like the araucaria and Indian cedar should never be pruned. The leaves of palm trees should never be cut until perfectly dead. Only when the leaves are ready to fall is the trunk fully developed, and cutting them before makes an unsymmetrical and easily diseased tree.

Shade trees sometimes need to have their lower branches removed. But it is better to attend to this when the tree is very young, as when a well developed tree is suddenly pruned up five or ten feet it is apt to result in death. In the case of those trees which need pruning or trimming, it is better to do a little each year than all at once.

The prevailing custom of "topping" or to be more exact, "pollarding" of the tree, stunts it and makes many dangerous wounds.

Some of the reasons for pruning given by the best authorities are the following: To rid the tree of all dead and diseased branches and those which cross and chafe each other. To make the top less heavy, so that the tree can withstand a heavy wind (as in the case of the soft maple). To introduce more light and air into the tree. (It is said that a skillful operator can remove at least one-third of the branches of a tree in such a manner that the casual observer will not know that any pruning has been done.) To restore equilibrium between root and branches, by removing some of the live wood.

In general, the proper time to prune is before the sap begins to flow.

The operation of pruning should begin at the top of the tree. It is very necessary to use a sharp saw, and make a smooth, clean cut, close to the trunk of the tree.

A wound more than one and one-half inches in diameter should be dressed with a thick coat of lead paint, or coal tar (preferably the former). This is to prevent decay, and the entrance of insect pests into the wound while it is healing.

Bruised bark should be treated in the same manner. When wounds are old, the decayed surface should first be removed.

The filling of cavities largely made by unskillful pruning, is a profession by itself. Tree surgery, as it is generally termed, is yet in its infancy, but no doubt many fine trees have already been saved by this means.—San Jose Mercury.

RAISING HARDY PLANTS FOR SALE.

Kate V. Saint-Maur in Woman's Home Companion for March claims that the ambitious country woman can add materially to her income by raising the old-time hardy plants for sale among city people with whom the revival of "Grandma's Garden" has become a craze.

Mrs. Saint-Maur says:

"There is such an endless variety of perennial plants that it is impossible to grow them all; in fact, it would be very foolish to try to do so. Select the best known and most popular kinds, and have some of different sizes, so that you can make up selections for beds. Hollyhocks, foxgloves, golden glow, monk's hood all range from three and a half to five feet in height. After them come phlox, larkspur, false dragon's head, Canterbury bells and bergamot. A step lower are bleeding heart, columbine, leopard's bane, asters, sweet williams and wallflowers. Still lower are Iceland poppies, Japanese primroses, wake robin and pansies.

"The first year it would add to your profit to grow a few of the annual varieties in the hotbed collection: Hollyhocks, sweet sultans, sweet tobacco, asters, wallflowers, mignonette and salvia. Among the perennials which will flower the first season if seed is sown in boxes or hotbeds, are monk's hood (which is one of the most charming of the tall blue flowers and comes also in white, and blue-white mixed); larkspur; Chinese bellflower (large bell-shaped flowers of steel blue, white and violet); heliotrope and marshmallows (pink, rose color, white with crimson spots, and golden yellow with maroon centers)—these are amongst the most valuable of the first-year bloomers, for they flower all through the summer. Three of the most fragrant annuals are sweet tobacco, sweet sultan and mignonette.

"Sweet williams are such old favorites, and are so multicolored that I have always been thankful that they flowered the first season. Meadowsweet—or goat's beard, as it is often called—is white and fragrant."

Don't Buy Nitrates
Fertilize With
FARMOGERM
High-Bred Nitrogen-Gathering Bacteria

Why buy expensive nitrate fertilizers when you can save most of the money and all of the time and work of spreading, and get much better results? Put the bacteria in your soil that will draw nitrogen from the air and convert it into all the nitrates the crop can use and store still more in the soil for future crops of any kind. Farmogerm contains the right bacteria in the right condition. That's why it will produce a bumper crop of any legume.

Price, $2.00 an Acre. Garden Size, 50c.

Ready for use. Just mix with water, moisten seed or spray. Bacteria guaranteed to be right. Put up for use with Alfalfa, Peas, Beans, all garden and field varieties, all the Clovers, Vetch, Sweet Peas and all legumes. Gives better results than nitrate of soda at fraction of cost and labor.

LET US PROVE IT.

Write for FREE BOOK **AB** which gives full particulars. When you order a bottle, mention crop you wish to try it on. Get our letters from users and our reports from high authorities. All in this book.

TWENTY-FIRST ANNUAL SESSION OF THE CALIFORNIA STATE BEE KEEPERS ASSOCIATION.

(Continued from Page 291.)

colony is strong enough, I give them another queen at once, provided I have one, and if not, I unite them with some other colony. When I find a queen that is somewhat doubtful, I leave her alone for awhile to see what she will do, and if she does not come up to what I think she should, I decapitate her. On the first examination I mark all colonies that are weak or of medium strength so I will know just the ones to look after later. I also see how much honey each one has, and any that does not have plenty, I also mark, also those that have more than they need, so I can tell at a glance where to go for a comb when needed. I have tried putting weak colonies over strong ones, as described by the late E. W. Alexander, of New York, but in this have been only partially successful. When it works, it is a big success, but when it fails it is about as successful a failure as anything I know of. I expect to try it more in the future in the hope that I may make more of a success of it than in the past. As the season advances and the strongest colonies become strong enough to spare some brood, or are likely to swarm, I take brood from them and help the medium colonies. I do not give any to the weak ones until later on, for fear a cold spell might come and the brood become chilled, on account of not having enough bees to protect it. As the weather becomes warmer, the weak ones can be built up very rapidly with brood from other colonies.

In regard to stimulative feeding in the spring, will say that I have practiced it only a very little, and, generally speaking, I do not think it pays, provided, of course, the hives are rich in stores. Should any be lacking in this respect, I think it certainly pays to feed them a small amount of syrup daily, until they are getting a little more than their daily needs from the field. Of course, locality makes a great deal of difference, but I think all bee keepers agree that all hives should be left heavy with honey in the fall. This is done not only to prevent starvation during winter, but to enable the bees to breed up rapidly in the spring. I think there is such a thing as erring on the safe side, and allowing the hives to become honey-bound so that the queen has not sufficient room to lay. In such cases, some of the combs should be removed and replaced with empty ones. I use excluders on my hives and produce extracted honey only, and it has been my practice to remove them at the end of the flow and not put them on again until just before the flow opens up. This allows the queen to use both stories for breeding, giving her a much larger brood nest than if confined to the lower story, and also tends to keep down swarming. When I start to extracting, the brood in the upper story is all sealed, and is not thrown out by the motion of the extractor, as would be the case if unsealed. I have tried uncapping the honey—scratching the surface of the combs—to stimulate breeding, but am not sure that it does any good. I am convinced, however, that it does not pay to manipulate colonies unnecessarily, and I believe we should handle them as little as is consistent with their needs. It should be the aim of every bee keeper to produce the largest amount of honey per colony possible. To do this, we should have large, powerful colonies of a good honey gathering strain, at the opening of the honey flow. It does not pay to spend our time trying to keep up bees that are not good honey gatherers after we have built them up. I had a good illustration of this last season. I bought about 60 colonies from a neighbor, as they were stronger in bees, and had more honey on an average than my own when I got them, April 15th. I expected a good deal of them, but I do not think they gathered more than one-half the honey mine did, all located in the same yard. Well, I didn't do a thing but kill all of those queens and requeen them from my own stock. This season being a failure, I had to furnish honey for those bees, from my own stock, to keep them from starving to death. Had these bees gathered as much honey as mine did, then all would have been heavy with honey. As it is, I am afraid I will find many light ones in the spring.

And now to sum up the whole matter: We should endeavor to have our bees go into winter quarters with young queens of the best strain possible, strong in young bees, heavy with honey, in good hives, well protected from wind and rain, and then give them our attention just when needed. For neglect for a few days, at certain times, will often cost a bee keeper many dollars. If we can succeed in building up all colonies so they will be just boiling over with bees at the opening of the honey flow, then we have reached an ideal condition in bee keeping, one that will cause us to laugh, as we see the honey rolling in by the ton. Bee keepers should leave no stone unturned to accomplish that end.

A THREE-BILLION BUSHEL CORN CROP.

The magnitude of the corn crop passes comprehension. Its 3,125,713,000 bushels exceed the former bumper crop of 1906 by over 198,000,000 bushels. It is the first three-billion bushel crop of anything that the country has ever grown. It is about 50 per cent greater than the total of all our other cereal crops for this year.

The corn crop occupied 114,002,000 acres the past season, yet so vast is this country and so varied are its agricultural resources that this area represents only a small proportion of its total improved farm acreage. If all of the improved acreage of Indiana, Illinois, Iowa and Missouri had been planted to corn last spring, those four states would readily have produced the nation's corn crop, while all of the other states could have produced other cereals, hay, pasture and miscellaneous crops. These four states actually had only a little less than one-third of the corn acreage of the entire country.

The value of the cotton crop with its seed is only three-fifths of the value of the corn crop; wheat is worth only two-fifths as much; hay less than one-half, and all other cereals together less than three-fourths as much as corn. And yet only about two-thirds of the feeding value of the corn crop is included in the ears and counted in these figures.—Breeders' Gazette.

Live Stock and Dairy

Dairymen and stockmen are requested to write of their experience. Mrs. Sherman is always willing to answer queries and this, with experience of other workers, will make this department of greater value.

MARKET FOR DRAFT HORSES.

From an address by Wayne Dinsmore before the Percheron Society of America, made before the students of Iowa Agricultural College, we quote:

"Horses and mules represent more than one-half of the total valuation of the livestock in the United States, and the valuation is on a very conservative estimate, the average valuation on mules being placed at $119 per head, and the average valuation on horses at $108 per head.

"The draft horse has done more to make possible the thorough cultivation of our farms and to permit of farming on a labor-saving basis than any other animal which we possess. He has made possible a high standard of life on our farms.

"Dr. Knapp, the special agent of the Department of Agriculture, who has made extended investigations into southern agriculture, has pointed out very clearly that the one great weakness in southern agricultural conditions lies in the low proportion of team force used per man. In many large districts through the South one man uses but one mule, whereas in such districts as Iowa, Nebraska and other prosperous Northern states practically four horses are used per man. The efficiency of the human worker is thus greatly multiplied, and the heavier tools and more modern machinery make possible much more thorough cultivation, with its corresponding results in larger crops and greater prosperity for the man who tills the soil.

"There has been in the past a great market in our large cities for heavy draft horses, and good prices have for many years been realized for horses of substantial weight and good draft qualities. This market still exists. It is possible that it may be in some degree curtailed by the development of the motor truck, although I have but recently read the frank admission of some of the most noted authorities in the auto world to the effect that the auto truck cannot expect to compete wih draft horses, save where the hauling is exceptionally heavy, of greater length than is usual, and where but little delay is connected with loading and unloading.

"In such work as freight hauling from the warehouses and large jobbing establishments to the freight depots, where the distance is relatively short and where teams must frequently stand for an hour or two, awaiting an opportunity to unload, the high cost of the auto truck precludes its economical use, and as hauling of this and similar kinds makes up a large part of the draft horse work in the cities, I do not look for as serious a curtailment in the city demand for draft horses in the future as many alarmists are expecting.

"I believe, however, that the greatest market for the draft horses of the future will be found on the farms. As the prices of farm products continue to advance, land value will inevitably advance, and to be successful we must so till the soil as to secure more abundant crops than before.

"High production on our farms comes only with thorough tilling of the soil. Plowing must be thoroughly done, and every furrow turned to as great a depth as the conditions of the soil and the crop to be grown render advisable. The plowed land must be disked, and this must be well and frequently done, especially during the spring months, when land not so handled tends to lose a large share of its stored-up moisture, particularly during the dry springs which we so frequently have.

"The most fertile fields are those which receive most liberal dressings of barnyard manure, and our modern machinery, which renders this work so easy, requires an abundance of power in the way of horseflesh. Cultivation, it is true, does not require such extremely heavy horses as the other work of the farm, yet animals must be of good weight and possess abundant strength to handle a riding cultivator for ten hours steady work in the field, particularly where the work is well done.

"Haying with six-foot mowers, twelve-foot rakes and elevating hay loaders requires horses of more than usual strength, and the modern self-binder was never built for animals of light weight.

"In fact, throughout all the farm operations we find urgent need for draft animals of the best conformation and with weight exceeding 1,600 pounds, even in working condition. In many of the farm operations, animals weighing in excess of 1,800 pounds can be more efficiently used than those of the lighter weight.

"It is true that there are many farmers who cannot see the advantage of using draft horses for farm work, but their number is steadily growing less. One of the arguments most frequently advanced is that draft horses are slower in field work and do more injury to the crops in turning than lighter horses weighing 1,100 and 1,200 pounds, but the charge of slowness is unfounded, for the long, swinging stride of the good drafter carries him over vastly more ground in a day than the shorter, fussier, but apparently more rapid step of his lightweight brother. So far as the crop damage in turning is concerned, practically all up-to-date farmers are now adopting the plan of leaving a twelve-foot headland in hay, which gives a much neater appearance to the fields, makes it possible to keep the fence rows clean from weeds, and also permits of turning without damaging the field crops. The headlands produce practically as much hay as any of the meadow lands, and it is a simple matter to adopt this plan.

"Aside from the fact that the farm work can be most efficiently and economically done by the use of heavy draft horses, we find that where intelligent methods prevail the farm work is being done by mares and such of their colts as are not yet of marketable age, which means that the work is being done by animals that are of productive value aside from their labor.

"The man who keeps geldings or mules for his farm work secures only their labor in return, while the man who keeps draft mares receives not

only their labor, but, in addition to this, their colts.

"It is true that somewhat more team force must be kept where the work is done by mares than where the work is done entirely by geldings, but when we consider that three mares can be counted upon to do as much as any team of geldings of an equal weight and strength, that the difference in feed cost will not exceed $60 per year, and that the three mares can be counted upon to produce, in addition to their labor, at least two colts that are worth $100 each as yearlings, it is apparent that the mares are the most profitable. The comparison just made is on the basis of grade mares, but where pure-bred mares are kept, the returns will be much greater."

WHY I CHOSE JERSEY.

By Charles N. Taylor, Artesia.

For a number of years I have been making an impartial investigation as to the relative merits of the different breeds of cows for dairy purposes. Having had no preference or choice, I was therefore influenced entirely on the finding of facts such as I could obtain from dairy journals, reports of competitive tests, reports of agricultural experimental stations, and from observation.

The basis of my selection was to find the cow that would produce the most butter fat on the least feed year in and year out.

I spent several months among the "grade" and "scrub" cows (which I am sorry to say are very numerous). Among the "scrub" cows I found that those that looked as though their grandmothers had been in the same pasture with a Jersey bull were the best of these very poor herds. Among the grades I found again that the Jersey bull was the sire of the best milk and butter producers of the grades. I would look at a herd of mixed breeds —grades of Shorthorn, Holstein, Jersey and others. I would ask the owner which were the best cows, and he would invariably point out a cow that showed the markings of the Jersey. The matter of the pure-bred cows of the different breeds was then taken up and investigated. Again I found the Jersey in first rank, and to me the evidence is overwhelming and absolutely convincing that the best dairy cow is the Jersey cow.

I am not partial to the Jersey because she is a Jersey. I would milk a mule if it gave 400 pounds of butter fat per year. It is purely a business proposition, and entirely free from sentiment. What I want is the most economical production of butter fat. I am thoroughly and completely satisfied that the Jersey has led them all in the past, is leading them all now, and will continue to lead them all in the future.

To my mind, the introduction of the Register of Merit by the American Jersey Cattle Club will do more good for the Jersey cow than anything else. It will divide the registered Jerseys into two classes, viz., those in the Register of Merit and those out of it. The beginner like myself will look for cows of individual merit or the sons and daughters of known performers. The Register of Merit gives an opportunity for permanent records of official performance, and is reliable information.

PREDICTION FAILED.

Some time back it was predicted that bicycles and auto-vehicles of various sorts would put horses out of business. Do the signs point to any such thing? In 1910 there were in the country 14,000,000 horses, average worth $44.61 each. In 1909 there were nearly 30,000,000 horses, average worth $95.64 each, showing the increase in average value to be more than 100 per cent. That, however, does not tell the whole story. All of the horses in the United States in 1900 were worth nearly $630,000,000, while all of the horses in the United States last year were worth nearly $2,867,000,000. That doesn't look much as if the horse were passing out, and there is everything in the situation to encourage breeders and farmers to give attention to raising more and better horses.—DeLand News.

SKIM MILK CALVES.

Answering question as to raising calves on skim milk and calf meal, Hoard's Dairyman says:

We feel very certain that under average conditions, the feeder cannot afford to deny the calf whole milk for at least two or three weeks. We believe that if the calf is raised, it should be fed properly from the start, and new, whole milk is, without question, the best feed for the calf. After the second or third week the whole milk may be gradually decreased and skim-milk added to take its place. This process of changing from whole to skim milk should be done gradually. There are calf meals upon the market which are being used with satisfaction, but we would not advise their use until the calf has reached the age of three or four weeks.

WELL-BRED ANIMALS.

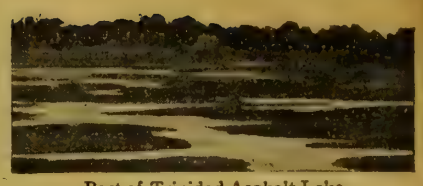
It has become an axiom, with some dairymen, that the best results are obtainable only with the best breeds of animals. But success with such animals implies also the best management; and not every beginner is capable of the skillful handling necessary with high-bred cows. The higher we get in the scale of animal life the more delicate the animal mechanism becomes, and the greater the need of wisdom in the human agency which controls its movements.

It is a long time before a baby can care for itself as well as can a bronco colt at one day old. A bronco colt can stand more simple hardship and abuse than a colt from a standard-bred trotting mare or a high-class draft animal; but the bronco will never have the great speed, at the trot, of the standard-bred; nor will it grow large enough to have the power of the drafter. The scrubby native can stand more hardship and abuse than a highly developed dairy cow capable of doing great work, and the latter loses her superior commercial value in unfavorable surroundings and under unskilled treatment.—Prof. Geo. P. Grout, University of Minn.

With systematic handling and judicious management, the hog is pretty nearly sure money. The cheapest and most profitable way to insure a healthy and rapid growth with young pigs is through the sow. She should be possessed of a strong and unimpairable digestion that is capable of converting coarse grains and roughage into easily digested milk.—Farm Journal.

Cattle do not relish eating after pigs, and colts are apt to injure hogs by chasing them.

Anthrax Cure, Milk Fever Outfits. See O. J. Weber Co., 225-227-229-231 East Sixth Street, Los Angeles.



Part of Trinidad Asphalt Lake

The costliest roofings are the roofings that don't last.

The roofing that *does* last is made of Trinidad Lake Asphalt—

Genasco

the Trinidad-Lake-Asphalt Roofing

Other roofings all have their drawbacks: Shingles crack, split, and rot; tin rusts; slate breaks and blows loose; coal-tar gets brittle and cracks; so do the many so-called "asphalt" roofings, because they lack the "live" lasting qualities of *natural* asphalt.

Genasco has the natural oils of Trinidad Lake asphalt sealed in it; and they keep the roofing always pliable and strong and defensive against all weathers. Genasco doesn't crack, rot, rust, or break. It is *permanently* waterproof. That means real economy.

It pays to cover the roof of every building on the farm with Genasco. Fully guaranteed.

The Kant-leak Kleet prevents nail-leaks, and waterproofs the roofing-seams without cement. Makes Genasco easier to apply than ever.

Ask your dealer for Genasco mineral or smooth surface Roofings with Kant-leak Kleets packed in the roll. Write us for the Good Roof Guide Book and samples.

NOTES ON THE HOG.

It is best to fatten and sell hogs young.

It costs no more to raise a good hog than a poor one.

Feed goes further with a young animal than an old one.

You can hardly push pigs too fast, providing you use the right kind of food.

Extra feed increases the growth of a proper kind and makes larger animals at maturity.

It often takes a number of generations to thoroughly change the disposition from timidity to quietude.

If when the hogs are growing fast their hind legs become weak, feed a little bone meal daily.

It is conducive to health to feed hogs where they can have the range of the pasture field.

The fairs give a good opportunity to compare breeds, and farmers should use this opportunity intelligently.

Whatever material is used for bedding, it should be changed sufficiently often to insure cleanliness.

It is nearly always best to save some of the old sows, especially to farrow the early spring litters.

The vigor and health of the hog are to some extent involved in the strength and texture of his bones, influencing to some extent his exercise.

Even with hogs the value of good feed is wonderfully increased by these attentions.

The cleaner the feed and feeding places, the better the quality of the pork in all.

A sow with a mean, cross temperament is always hard to deal with, and this disposition often causes loss of the litters.

A ground floor is the best for the sleeping quarters for the reason that the soil retains the heat, and is much warmer than plank in winter and cooler in summer.

If the swine are in the fattening stage they should have all they will eat up clean, but growing animals should have just enough to keep them in a thrifty growing condition.—Western Farmer.

NOT PERFECT.

A horse dealer was showing a horse to a prospective buyer. After running him back and forward for a few minutes he stopped and said to the buyer: "What do you think of his coat? Isn't he a dandy?"

The buyer, noticing that the horse had the heaves, replied: "Yes, I like his coat, all right, but I don't like his pants."—Tit Bits.

The dairyman should keep a complete record of each cow in his herd, including both a feed record and a milk record. Then only is he in a position to find the standing of each cow and tell which cows are profitable and which are unprofitable. Then only can he know how much feed he can afford to give each cow to make the highest profit.

The cow testing associations are already producing very good results wherever they are under good management. In almost every instance the farmers who do not join soon perceive the advantage of the plan and the number of the herds put under regular inspection increases very fast. It all depends upon the ability of the inspector. A thoroughly competent tester not only shows the dairyman just where he stands in a business way, but also helps him to make the various practical changes which improve the rations, cut down the cost of production and increase the profits. —American Cultivator.

Do your cows milk hard? Send 50 cents for teat expander. O. J. Weber Co., 225-227-229-231 East Sixth St., Los Angeles.

SUGAR.

The average American family consumes about 400 pounds of sugar in a year. The average, per family, has increased 140 pounds in the last thirty years. The figures show that we are the largest consumers of sugar, in proportion to population, of any country in the world. That may explain, in part, the present high cost of living among American families. It indicates, at least, that we do not hesitate in getting what we want, whether the home supply be sufficient or not, and that the price has nothing to do with the quantity consumed.

Sugar is one of the necessities of every home. It is so much of a necessity that for every man, woman and child in the United States there must be a supply equal to seventy-five pounds in twelve months. And it does not matter what kind of a home we have, whether shanty or mansion, sugar is considered one of the family food requirements.

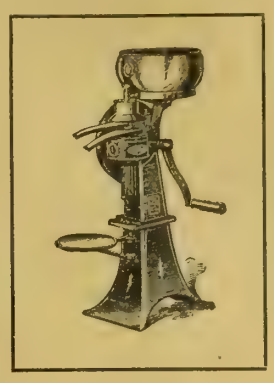
Statistics as published by the Department of Agriculture show that one-half of our imports during the last year have been farm products, largely sugar, tobacco, silk, cotton and fibers. Unless we increase the productiveness of our farms, we shall most certainly have free importations of grain from Canada and of cattle from Canada and Mexico. Farmers must either increase their yield per acre or yield to the cry of the hungry stomach. To greatly increase the yield per acre, we must have smaller farms and more intensive cultivation. It would seem, therefore, that, whether we would or not, we will be forced to revolutionize to a very great extent our methods of farming.—Wallace's Farmer.

Bad usage is, more often than not, responsible for the short life of a really first-class scrubbing brush. After using the brush, never lay it upside down, as any moisture on the bristles will sink into the back and make the brush soggy. For the same reason the household broom should never be placed in the corner with the straw part upward. Instead, fasten it to a catch in the wall by a piece of string tied firmly to the end of the handle or run through a hole in it.

What Makes a Cream Separator Good or Bad?

It takes something besides cast iron, red paint and hot air to make a separator that will skim milk clean twice a day 365 days in the year for 15 or 20 years.

If some of the farmers who are thinking of buying a cream separator this season, and have been half persuaded by extravagant advertising to "save one-third the cost" by buying a machine of the "Just-as-good-as-the-DE LAVAL" or the "mail order" kind, could only listen to the experience of a few of the thousands of the users of such machines who have traded them in for DE LAVALS during the past year, they would be forcibly reminded of the old adage which runs "Save at the spout and waste at the bung-hole."



Any competent separator mechanic with a knowledge of materials and high-class separator construction will tell you that the marvel is, not that "mail order" machines are sold so cheaply, but that they succeed in getting the price they do.

High-grade separators cannot be manufactured like harvesters, plows and other farm machinery. A properly built separator is almost as delicate and exacting in its construction and measurements as a watch.

DE LAVAL machines are constructed in the best equipped cream separator factory in the world by skilled workmen. The very highest grade of material we can get is used in all wearing parts, and our limit of variation in most measurements is less than one two-thousandth of an inch.

Before you decide on the purchase of a cream separator be sure to

See and Try a DE LAVAL

It will be only a question of time before you get a DE LAVAL anyway, so why not save yourself a lot of costly separator experience by starting right with the DE LAVAL?

BUY THE LOWEST COST ENGINE

MADE. Lowest fuel cost; lowest up-keep cost; easiest on the machine it operates, delivering steadier power than any other gasoline engine, adapting it especially for operating farm machinery, with better results and least waste of grain. Lowest fuel cost for it runs on Gasoline, Kerosene, Distillate, Gas or Alcohol and has perfect lubrication. Lowest cost because it delivers greatest available power per horse. A slow speed, high duty engine. Starts easier and quicker than any other engine, occupies less space, is less cumbersome, with less vibration, therefore adapting it for either stationary, portable or traction use. **IT IS THE POWER CONTRACTOR'S FAVORITE ENGINE.** No engine made has so wide a range of use. **YOU WILL MAKE A MISTAKE IF YOU DO NOT WRITE US FOR INFORMATION.** 1½ H P. to 5½ H. P. single cylinder. 6 to 20 H. P. two cylinder. 30 to 50 H. P. four cylinder. State your requirements and get our advise. **THE TEMPLE PUMP CO., Manufacturers. 472 West 15th St., Chicago, U. S. A.** This is our 58th year.

SAVE YOUR TIME WATER and GRADING BY IRRIGATING WITH AMERICAN SURFACE IRRIGATION PIPE

The **PIPE RECOMMENDED BY ALL USERS.** It is the **ONLY SCIENTIFICALLY CONSTRUCTED SURFACE IRRIGATION PIPE** on the market. **THERE'S NO ROUND SEAMS TO LEAK,** retard the flow of water or weaken the pipe. This pipe is easily handled and cheaper than flumes. It will last a life-time. For irrigating alfalfa it is the only pipe to use. We make **RIVETED PIPE AND TANKS.** Write for Illustrated Catalogue, also **SPECIAL IRRIGATION FOLDER** which may mean much to you.

PRODUCE MARKET.—Los Angeles Market; San Francisco Market; Almond Crop; Citrus Market; 318, 319.

APIARY INSPECTION.

It is to be hoped that the state legislature will pass the bill calling for more perfect protection for the apiaries of the state. It has gone through the Assembly and is now in the hands of the Agricultural Committee of the Senate, where there seems to have been a hitch because of the fact that the appointive power of the state examining board lies in the hands of the State Bee Keepers Association, as appointments must be made by the Governor from a list furnished by the state organization of the bee men, which organization was formed more than a score of years ago when bee keeping was largely confined to the southern counties. Since then the industry has been greatly extended and the San Joaquin Valley and Northern California both have organizations having to do with their local situations, and, in addition, are strong factors in the welfare of the industry at large. It goes without saying that these should be maintained, but it would seem to us that affiliation with the state organization, permitted under its by-laws at a nominal cost, would contribute to the best interests of the entire industry. The difficulties before bee keepers in the production of honey, even in California, are great enough as it is and they should not be increased by contention within the ranks.

REFORESTING.

The Tri-Counties Reforestation Committee has had charge of a fund during the past two years furnished in part by the state legislature and in part by the national congress. This fund was $10,000, but it is now hoped to duplicate it within the coming two years. The expenditure is a wise one for it has to do with fire trails or alleyways over the watersheds which supply waters to irrigate the orchards of the valley to the value of millions of dollars. The state legislature will work great injury to a very rich section should it refuse to grant this request. The proposition is to have the appropriation cover "the southern slope of the San Bernardino mountains and the San Gabriel mountains from San Antonio canyon east to the Cajon pass."

"IN THE ORANGE COUNTRY."

The March number of Sunset is one of the handsomest ever put out by that magazine. The first article, as in the two preceding numbers, is by Mr. Walter V. Woehlke of Los Angeles. Mr. Woehlke is a most interesting writer with a wonderful way of presenting the truth, and he makes one read his articles from start to finish. It is "In the Orange Country" and describes the section of this state "Where an orchard is a mine. The human factor among gold bearing trees of California."

WOOD PULP EXPERIMENTS.

The department of agriculture is at present experimenting in the manufacture of paper from different woods than have been used heretofore. The experiments are of a most practical nature, consisting in the construction of actual paper mills and the manufacturing of paper in a commercial way, covering woods from all parts of the country, at least those which are found in quantity sufficient to make experiments of value. These mills will utilize great quantities of timber which is altogether too small for the lumber mills.

In addition to the benefit which the public will derive from the advancement of forest conservation in consequence of the wood pulp experiments of the government, there is the further benefit of cheaper paper which it is believed these experiments should make possible. The price of paper of the cheaper grades, including newspaper, has been advancing rapidly of recent years as the supply of spruce has dwindled, and American mills are now drawing a large part of their supply from Canada. If ground pulp of the requisite quality can be made from new and abundant woods as cheaply as it is made from spruce, one of the most serious problems of the newspaper publisher nowadays will or should be considerably simplified.

At its last session the Massachusetts legislature instructed its board of education to investigate the practicability and desirability of establishing a farm school in the city of Worcester in which instruction shall be given in raising fruit, vegetables, grains, etc. Further, that the board shall investigate the advisability of establishing a general system of agricultural schools throughout the commonwealth. The board comes to the session of 1911 with 104 pages of report of its conclusions, first of which is that there is no systematic or general recognition of agriculture in the elementary schools in the state; further, that instruction in agriculture is of direct value in itself because of its contributing to the prosperity of the community and its aiding in the adoption of improved methods. Teachers have been enabled to increase interest among pupils in the activities of the farm. The board believes that boys may be induced to remain with the farm and accomplish better results than was formerly possible. It recommends promotion of elementary nature study, school gardens, summer courses of the agricultural college, and general encouragement on the part of boards of education.

AGRICULTURE.

Agriculture, the basic industry of the country and of the world, is entitled to the foremost position in legislative affairs. History proves that in all countries where agriculture has prospered all other industries have prospered, and where agriculture has declined, all other industries have declined; therefore, the promotion of agriculture means the promotion of manufacturing, transportation and commercial interests and the interests of the people engaged therein. Agriculture does not depend upon other industries for prosperity, but other industries depend upon agriculture as the basis of their prosperity.—The Grange.

ON TIME.

The circulation of The Cultivator has increased during the past years until the number of papers now required to send to our subscribers makes it necessary to go earlier to press. Formerly material of a news nature might be touched upon as late as Wednesday morning, but at the present time we find it impossible to handle any new material excepting markets later than Monday evening. We call attention to this because many queries and other material sent to us the first of the week cannot appear until the issue of the following week. Especially in the matter of inquiries we may say that it has been the plan of The Cultivator to get the very best information to answer points raised. In order to do this some of the queries are sent to practical workers in the field. Sometimes it is necessary for these to go to the state university or to the experiment station staff in other parts of the state, so if queries are not answered at once, bear in mind the delay is occasioned by desire to secure the best information to be had. But in regard to the news notes, such as programs of important agricultural meetings, we would urge our friends to give them to us the last of the week preceding date of issue.

C. E. RUMSEY.

The passing of C. E. Rumsey takes one of our brightest men. Mr. Rumsey has only been engaged in California horticulture for ten years, but in that time he had aided materially in lifting the standard of work. He was one of the first to take up with the suggestions of Mr. Powell, and in order to carry them out he built a separate packing house to put up a special pack which he felt would make a name for him and for his house. We heard him at one time remark that the extra care he was giving in packing added an expense of about ten cents a box, but the additional cost came back to him many times over in the higher prices which the exceptionally fancy pack commanded. Not only was this profitable to Mr. Rumsey, but it gave to the whole citrus industry an uplift which it needed. He was always quick to take up with suggestions, if important, and equally as quick to pass them on to others. In this he was the life of many a horticultural meeting.

GROWTH OF THE GRANGE.

During the year one state not entitled to representation one year ago has been added to the list. Four hundred and fifty-four subordinate granges have been organized and reorganized, which is a larger number than in any year with one exception for thirty-five years and that the year previous. The receipts for dues by the National Treasurer indicate a gain of 85,000 in paid membership, showing a net gain in every state except four, which speaks forcibly and eloquently for the splendid growth made during the year and indicates a prosperous condition of the Order in all sections of the country.—The Grange.

The Denver and Rio Grande railroad is following the Southern Pacific plan of demonstration trains excepting, we notice, that "four commodious baggage cars will contain an exhibit on agronomy, etc." We can inform the Denver and Rio Grande that the Southern Pacific takes seven large, well-lighted chair coaches and after removing the chairs, installs exhibits with some style. The Denver and Rio Grande, however, seems to have some valuable exhibits and makes a nine-day trip, stopping at various Colorado points along its line.

The consulate general of Japan at San Francisco furnishes a leaflet with figures showing that the number of Japanese in this state is being reduced every year. In 1910 there departed from Japan for the United States 924 laborers and 2,098 non-laborers, or a total of 3,022 Japanese entering this country. The arrivals in Japan from the United States were 4,823 laborers, 278 non-laborers, showing an excess of arrivals in Japan over departures for this country of 2,079.

Agricultural News Notes of the Pacific Coast

Northern California

Truckee, Nevada county, is harvesting an immense ice crop.

Colusa farmers are forming a stock company for the raising of sugar beets.

Mud hens are destroying great quantities of growing grain in Sutter county.

Corning, Tehama county, claims its orange groves have been most profitable this season.

Gridley farmers are contracting with the J. K. Armsby Co., for extensive plantings of tomatoes.

The Chamber of Commerce of Oroville has fixed upon November 20-25 as dates for its citrus fair.

An artesian flow of water has been struck at a depth of 195 feet on a ranch near Dixon, Solano county.

A bunch of Oregon men have recently purchased an extensive tract of land near Willows, Glenn county.

The government has announced that it will sell 25,000 feet of timber of the Crater Lake forest reserve.

Ukiah is entering more and more into the poultry industry, and now has one hatching plant with a 25,000-egg capacity.

Rohnerville, Humboldt county, is elated over the winning of first premium by her apples at an apple show at St. Joseph, Mo.

About 9,000 acres along the main fork of the Stanislaus river in Calaveras county will be opened by the forest service for grazing.

Residents of Lassen county are working for a branch of the state highway in Lassen and Tehama counties from Susanville to Red Bluff.

The hop growers of Yuba, Yolo and Sutter districts met recently and formed an association which it is hoped will aid them in securing better returns.

Irrigators of the North are more hopeful of the heading off of the Lake Tahoe contract by which the state of Nevada was to secure immensely valuable water rights.

The incorporation papers of the Sebastopol Apple Growers Union have been received, and the growers feel hopeful of more satisfactory marketing conditions next season.

Upper Mattole, Humboldt county, reports that some stock has been lost because of the long continued storms of this winter. At present the weather conditions are more favorable.

The bill before the state legislature calling for state aid for county or district fairs will probably pass favorable to the district fair plan. It calls for six districts in the entire state.

The last storm was a freak in that it gave snow to many sections of the state. In the city of Sacramento, and many towns near by, flakes came down and left a coating of the "beautiful."

The Santa Rosa Grange sent a delegate to San Francisco to present the matter of selling eggs by weight to the Produce Exchange, and the proposition has been endorsed by that organization.

The Cloverdale Citrus Fair did not receive quite so good an attendance as usual, it is claimed because of the citrus fair held in Sacramento. The gate receipts were not sufficient to meet expenses.

Central California

Raisin Day, April 29.

The state's output of canned goods aggregated $2,656,891.

Three and a quarter cents is being offered for 1911 raisins.

Salinas Valley farmers are plowing with gasoline tractors.

California's dried apricots aggregated 30,000,000 pounds last year.

A committee has been appointed to push the matter of the West Side irrigation scheme.

A large area is being planted to eucalyptus in the southern part of Tulare county.

An association of horse owners at Salinas has just purchased a fine imported Percheron stallion.

Watsonville reports strenuous effort to completely eradicate San José scale from its apple orchards.

An agent of an Iowa homeseekers' organization is in Fresno, looking for lands suitable for subdivision.

Madera county residents are taking steps to beautify their main thoroughfares by planting shade trees.

Poultrymen of Santa Cruz county are uniting in the formation of a cooperative poultrymen's association.

The Fresno Home Packing Company has sent circulars to its patrons stating that raisins will go to four cents.

The Spreckels Sugar Company is exhibiting to beet growers a beet which is claimed to be, in size, shape and sugar content, perfect.

Raisin men of the San Joaquin Valley are asking why no exhibit of raisins was made at the recent Fruit Jobbers Convention at Sacramento.

The Tulare county board of supervisors is making a fight against squirrels, and has appointed inspectors to report on various sections of the county.

The boundaries of the big irrigation district along the west side of the San Joaquin Valley have been reduced from 1,700,000 acres to approximately 1,000,000.

Apple growers of the Pajaro Valley section are demanding an amendment to the proposed law prohibiting the sale of perishable food that has been in cold storage longer than ninety days.

J. W. Guiberson, of Corcoran, one of the largest growers of alfalfa in the valley, is planning to increase his alfalfa acreage from 1,200 to 2,200. He expects soon to stock the place with dairy cattle.

Residents of the island district of the Laguna da Tache grant in Fresno county are protesting against the water service, claiming the Lemoore Canal Company is taking water which belongs to them.

A San Jose subscriber writes that Santa Clara Valley's weather has been simply perfect this season. Almonds were in bloom two weeks ago, and hopes are expressed that bracing mornings will destroy the thrips.

Poultrymen of Santa Clara county are discussing the matter of either a state or coast organization to look after the best interests of the industry, and especially to get proper recognition from the management of the Panama-Pacific Exposition.

Southern California

The Pacific States Tobacco Company will plant 200 acres to tobacco at Yorba, Orange county.

The Lompoc Produce Company has purchased during the season 56,000 sacks of local potatoes.

Land owners at High Grove, Riverside county, are suing to quiet title to Gage Canal water rights.

The acreage of celery in Orange county this year is 2,700, or nearly one-half that of a few years ago.

The efforts to compel the removal of the weir which diverts water for the Imperial Valley irrigation system are being resisted.

Some of the vegetable gardens above Redlands, especially in the Yucaipe, were injured by the snow which fell in the valley during the last storm.

Orange growers of Southern California had a great gathering in Highland to celebrate the pre-cooling decision of the interstate commerce commission.

The last rain put California to the good so that there is now no fear but that the year will be a complete success so far as irrigation water is concerned.

Citrus growers from all over the state are holding a special session under direction of the state horticultural commission at San Bernardino this week.

The city of El Centro, Imperial Valley, is the first to take advantage of the state law authorizing the setting of trees by the municipality along the highways.

A rancher at Santa Ynez, Santa Barbara county, has a way of placing traps surrounded by newspapers, as if a picnic party had left the place, and catches many coyotes.

The National Orange Show which is on at San Bernardino this week has a novel feature in a complete orange-packing plant, showing each step in the preparation and packing of oranges.

Mr. C. E. Rumsey, one of the brightest men in California horticulture, whose orange grove at Riverside has one of the finest packing houses in the world, died at his home at Riverside on February 27.

Ventura county is taking the initiative in the matter of securing a just proportion of the $18,000,000 state good roads fund, and is urging a meeting at some point in Southern California where all counties can unite.

On his recent visit to the Imperial Valley, President Lovett of the Southern Pacific intimated that he would expect $5,000,000 from the settlers because of expenditures made in putting the Colorado within its banks.

Filings have been made on the tidelands of Newport Bay and other ocean frontage of Orange county for the establishing of oyster farms. The city of Santa Ana, however, maintains it is to prevent the dumping of Santa Ana sewage into the bay.

Tree wardens from all sections of Southern California met in Riverside on the last day of February and discussed the matter of public control of the roadsides and the rousing of a greater public sentiment demanding beautifying of California roadsides.

The Coast

Hops are now selling at Portland, Oregon, at 19 cents.

Timothy hay is selling at $22 per ton at Brady, Montana.

Effort is being made to drain some 9,000 acres at Ephraim, Idaho.

Heavy selling of potatoes at Seattle has weakened the market.

The Rogue River Valley Fruit and Produce Association has declared a dividend of 20 per cent.

The fruit growers of the Yakima Valley, Washington, have organized a co-operative shipping association.

Spokane reports the potato market as materially weakening, $1.25 being the top notch at the present time.

The first year of a school of practical agriculture at the Idaho university has attracted thirty-two students.

Over a quarter of a million acres of desert land has been filed on in the Sudphur Springs Valley within the past year.

The Oregon Sweet Pea Society has decided to hold an exhibition the coming summer, and is offering exceptional prizes.

The earth on the Arizona side of the siphon under the Colorado river near Yuma continues to cave in, and is giving much trouble.

A company of farmers near Ritzville, Washington, has secured a large tract of land, which they will proceed to irrigate by pumping.

Attention is being directed to the rich lands in the Sulphur Springs Valley, Southern Arizona. Wilcox is the principal town of the valley.

The four weeks course for creamerymen was held at the Montana Agricultural College, at which seventy farmers and creamerymen attended.

More than 30,000 farmers of Utah and Southern Idaho have visited the demonstration train conducted over various railroads of those two states.

Governor Norris of Montana is crowding the legislature to secure the enactment of measures looking toward the conservation of natural resources.

Nearly 60,000 acres of land in Western Montana have been restored to entry because of being unfitted for irrigation, for which they were being held.

Farmers near Opportunity, Washington, are urging the state college at Pullman to take up the matter of bacteria, which are seriously blighting the tomatoes.

A farmer at Great Falls, Montana, lost a hog, which fell into a pit, where it remained for 79 days. Its weight before falling in was 225 pounds, and 90 pounds when rescued. The hog is again laying on fat.

Hungry insurrectos took possession of the grading camp working on the levees of the Colorado below the Imperial Valley, and contractors have appealed to the United States for protection of their supplies.

A committee appointed at the wheat growers convention at Pullman last year to investigate as to the cost of wheat production estimated that in order to make money on wheat, pay interest, and all expenses considered, the farmer should grow at least thirty-five bushels per acre.

1911 SEED CATALOG

If your name is not on our list, please send us your address for a copy. It is a good one, well worth having; sent free and postpaid. We have secured the California agency of the

Prairie State Incubators

The best—bar none. First carload selling fast. Come in and see them—or send for Prairie State Catalog. We also have a carload of the

Baby Buckeyes
50-Egg Incubator for $7.00

Purchaser can operate it for forty days, and if it does not meet with his entire approval, it may be returned to us and the price paid will be promptly refunded. They go like hot cakes. If you cannot come in, send for a Buckeye Catalog. When the chicks are hatched, don't forget the old reliable

117 Miles Ave., Oakland, Cal., Nov. 12, 1910

Cycle Hatcher Co., Oakland, Cal.

Gentlemen: A year ago we started with the Philo System, and raised as fine a lot of White Orpington pullets as anyone would wish to see. The two machines we purchased of you last season have given excellent satisfaction. We shall probably need more this year, and shall use the Cycle machines in preference to a larger incubator. Yours truly, S. N. Haines

Practical Poultry Culture

SHIPPING BABY CHICKS.

Answering the questions as to boxing and shipping day-old chicks, two writers in the Rural New Yorker give the following:

In boxing "day olds" for shipment by express we use what we call "flats" or shallow boxes four to five inches high, 15 to 18 inches wide, and about two feet long, holding 100 to 200 chicks. First take a strip of coarse muslin, or even burlap will do, and lay one end of it across the box on which place a layer of cotton batting, thin if the weather is warm, and thicker if cold. Then fold back the muslin and press the pad thus formed down evenly on the bottom and against the edges of the box, when it is ready for the chicks. Now, being very careful not to let the chicks get chilled, the box is filled evenly, but not piled up. Then fold the muslin across over the chicks and put on another layer of batting, enough to fill the box, then you fold back the muslin and nail strips closely for a cover, and they are ready for the devious ways of the express company.—Floyd G. White.

The business of hatching and selling day-old chicks has increased enormously within two years. To many people who are not familiar with the poultry business this matter is entirely new, and they do not understand how it is possible to send the tender little chicks any great distance without many of them dying on the way. As a matter of fact the chick 10 hours after he has kicked himself loose from the egg shell is in much better condition to be safely shipped 500 to 1000 miles than he would be when a week or two weeks old. In his body is the entire yolk of the egg which was surrounded by the chick only a short time before it left the shell. This yolk furnishes sufficient nourishment to sustain the chick's life for four or five days; the only thing to be provided is warmth; and that the chick itself furnishes, as each little body is a furnace generating heat, and if enough chicks are kept together, say 25 to 50, and the heat is kept from being dissipated by a burlap or muslin cover over the box containing the chicks, they may be safely snipped any distance which can be covered by express trains in three or four days. The muslin cover allows sufficient ventilation, and practically the greatest risk the chicks have to run is the care of the express agent. He may be overkind and put the chicks so near the stove or steam-pipes that they become overheated, or carelessly leave them where a strong draft of cold air may chill them; but with reasonable care they may be shipped 500 miles and the loss not exced two or three per cent.

This opens up great possibilities for the man who desires to start in the poultry business; for there is no expense for incubators and an incubator cellar, no loss from infertile eggs or chicks "dead in the shell," and then better yet, he can have all his flock practically of the same age, which is a very great advantage in raising the chicks. White Leghorn chicks a day old are advertised for sale in all the poultry magazines for $10 per 100. Suppose a man pays $50 for 500 chicks May 1. Allowing a loss by hawks, skunks and other causes of 20 per cent, he would have in the fall 400 head, worth a dollar apiece. Or if he sold the cokerels for broilers when one to two pounds in weight, which would under ordinary conditions pay the entire cost of raising the pullets, he ought to have 200 good pullets ready to lay in September or October and keep it up all winter. This, of course, is supposing that the chicks have been well cared for from the time they were received. I have been asked "what proportion of the chicks received in this way can be expected to live?" I would answer, just about as many as if they had been hatched in your own house and carried across the road to the brooder. The brooding is the most important part, and the heatless brooder has come to stay.

My own experience and what I saw done by my neighbors last year convinces me that stronger chicks can be raised without heat than with. Mr. Fred Gammack raised 1600 White Leghorn chicks last year in cheese boxes, simply cheese boxes, obtained at the grocery stores in Hartford. No artificial heat whatever was used. Last fall I went through his poultry houses, and never saw a thriftier lot of birds, and he tells me they are laying to beat anything in his experience. Mr. Gammack takes stiff paper—strawboard—and makes a little yard in front of the cheese box, tacking the strawboard to the sides of the box, and cutting an oval hole on each side of the box where the strawboard joins it, so that the chicks when they crowd in the corners, crowd themselves through the holes right into the box. An iron wire ring fitting loosely inside the box has a "sheet" sewed to it, and one or two cotton stuffed "blankets" are dropped on the "sheet." The ring is suspended from the top edge of the box by bent wires. That is all the "mother" the chicks have, and it does the business. The cheese boxes cost nothing, the rest of the material five or 10 cents. A cheap way certainly of brooding 25 or 30 chicks. Mr. Gammack had a lot of the old lamp brooders; he tore the insides all out, retaining only the four sides and the roof, and put the cheese boxes inside on the ground. When the chicks were two weeks old the paper "yard" was removed, and the chicks had the run of the inside of the brooder, and remained there until large enough to be put in colony houses out in the cornfield. For the man who has not a suitable place to keep incubators, or the time to attend to them, the opportunity to buy day-old chicks is a great convenience. Orders for chicks should be sent in to the dealers as early as possible, stating the time when chicks will be wanted. Two years ago I bought 200 day-old chicks—R. I. Reds; they had to be carried about four miles, then shipped to me by train, and carried two miles to my place. The chicks arrived in good condition, not a dead one in the lot, and I raised most of them, selling the cockerels for broilers. I selected 40 of the pullets in the fall, put them in a 10x20 foot house, and they gave me 16 to 20 eggs a day all winter.—Geo. A. Cosgrove.

Don't do a thing a certain way, just because a neighbor does or does not do it that way. Every successful man does his own thinking.

POINTS IN BREEDING.

A certain writer defines breeding of fancy fowls as "breeding with particular reference to points which have no bearing on the practical usefulness of the breed," and then draws the sage conclusion that "the breeding of 'fancy' poultry is, therefore, a system of breeding for non-essentials." How wonderful are the ways of logic!

Once in a while a man is found brave enough to defend the mongrel hen. It is well, for if anything in this world and in this age of the world, when the thoroughbred cock grows in nearly every backyard and the thoroughbred hen cackles in every hamlet needs defense, it is the mongrel hen.

It is better to know one thing thoroughly than to know many things partially. The man of one idea is the man that the times demand. This is the day of the specialist, the day, not of general culture, but of thorough, though limited knowledge. A specialist may not be an entertaining companion but he is the man whom you consult when you wish to know anything about his specialty. In poultry breeding the men who stick to one variety seem to be the men who are making the most money out of their fowls. Whether they get the most pleasure out of their business may be open to debate. But that is another story.

Without a definite standard the judging of fowls would be a farce; without competent judging poultry exhibitions would be a failure; without poultry exhibitions no distinsctive breed of fowls would long exist in its purity.

Fashions in fowls, like fashions in everything else, animate or inanimate, change from time to time. Ideals, practically realized, must be pushed to a farther point, so that they may remain ideals, and this progress in ideals is the cause of change in the fashions in fowls.

Even in eggs is the influence of fashion seen. One market demands a white, another market a brown egg, or in other words, white eggs are fashionable in one place and brown eggs are fashionable in another place.

Each nation sets the fashions in fowls for itself. In England the Leghorn is beefy, in America slighter in build, more graceful and airy.

Here is a recommended recipe for making a wet mash. Fill a suitable vessel nearly full of fresh water and add one quart of whole plump oats; after the oats have soaked about five hours, add one quart of ground beef scraps; the next morning, twenty-four hours after the oats were put in soak, add one quart of corn meal, and from one to two quarts of wheat bran. Stir until the ingredients are thoroughly intermixed and the mash is reasonably stiff. Then feed. The hens and chickens like it, and the former will show their appreciation of it by laying freely, while the latter in their rapid growth will testify as to its good qualities. Fine grit or fine oyster shells may be added occasionally with advantage.

Cleanliness is next to success, but always a little in advance of it.

Cleanliness is not good health, but a condition to good health. Healthy fowls may be found in nasty surroundings; they are pretty certain to be found in clean ones.

It is with chickens, as it is with dahlias, that the best is the kind to raise. There is some degree of beauty in the low-bred sorts of both, but when they are compared with the best this beauty pales into insignificance. One is, relatively speaking, wasting his time in cultivating and rearing the inferior sorts.

Condemn a fancier because he follows the fashions in fowls? No, sir. For by the same token you would condemn the practical poultryman who follows the fashion in the color of eggs and in the color of the skin and shanks of market poultry; you would condemn every business practice, every industrial method. Everywhere fashion rules and the hard-headed practical man, as well as the fancier, and as truly and fully obeys. "The butcher, baker and the candlestick-maker" are all governed by the decrees of fashion in their several occupations. Condemn the fancier? Not on your life.

There are three cardinal principles in successful poultry keeping and they are: first, cleanliness; second, cleanliness, and third cleanliness.

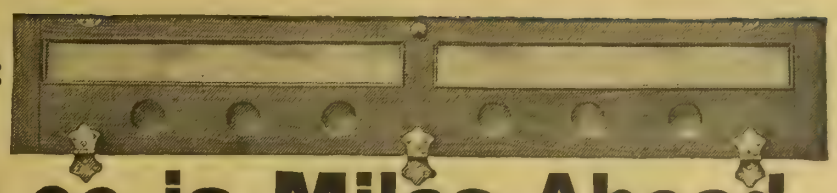
If you haven't tried it, just try soaking oats in water for twenty-four hours and using them as one of the ingredients of the wet mash. You will be pleased with the results.

Do everything that needs to be done, when it needs to be done. Don't delay for a single day, but, as you may, do right away, ere set of sun, what must be done, is, so they say, the only way to make fowls pay.—Successful Poultry Journal.

South Africa has prohibited the exporting of ostrich eggs and live birds, and imposes heavy fines for any attempt to evade this rule. It is hoped to corner the feather market, but there are many birds outside of the Cape. Ostrich farms have been established in the South of France, in Belgium, in England and in this country. The largest number of ostriches in one locality outside of South Africa is in the Salt River valley, Arizona. There are 7000 birds on farms there and they are raised very successfully. The birds at two years old produce about $25 of feathers a year. Birds are known to live to a great age, some reaching 75 years.

An incubator will not feed or regulate itself as the hen does, and we must not expect as good results until we have had some experience, and we should not blame the incubator because of poor eggs, a poor location causing uneven temperature, or our own carelessness.

This open front door makes perfect ventilation



Mandy Lee is Miles Ahead

It is the only Incubator without a "Sealed," Air-tight Egg Chamber. It supplies the life-giving oxygen freely, draws off the carbonic acid gas, and is saving the lives of millions of chicks.

READ the story of the Mandy Lee triumph in our new catalog. Other incubators are already preparing to imitate and profit by our great discovery.

No guessing with a Mandy Lee

You cannot afford to buy an old-theory incubator which may go out of date and be discarded next year. You should know the truth *now* about the great discovery. The book is free. Ask for it.

There IS Something New in Incubators

We have taken the boldest and most important step ever taken in incubator building. See the openings into the egg chamber? They mean the saving of chicks' lives. It is the key to *right* hatching. Ventilation in the Mandy Lee is now perfect. It goes on all the time, neither above nor below, but right *at the eggs*. Every minute of the hatch the life-giving oxygen is freely passing in to the eggs and the carbonic-acid gas is passing out. And correct ventilation is just one of the great Mandy Lee features.

We Don't Guess—We Measure

The Mandy Lee is as far in advance of other incubators in heat and moisture as it is in ventilation. We do not guess at anything. The sensitive regulator controls heat to the fraction of a degree and *we measure moisture* just as accurately with the Mandy Lee Hygrometer (one sent with every incubator). You know what you are doing. *You* measure and control moisture; *you* control the hatch. The Mandy Lee is the all-season, all climate, all condition hatcher, always producing the most and the strongest chicks.

NEW OUTDOOR BROODER
Heated—Storm-proof

Mandy Lee Brooders give direct contact heat to the backs of the chicks. That is *real* mothering, the most important thing in poultry. Hovers are raised and lowered as weather gets warmer or cooler—heated from end to end. Chicks do not pile up and smother. Write to-day for catalog and full information.

The Poultry Question Solved

If you have been hesitating about raising poultry on account of food difficulties, be assured that you need delay no longer.

Start Now--You can succeed.

The poultry outlook is better than ever before, and there is a big demand at all seasons.

We are the largest POULTRY FOOD manufacturers in California and our success is due to the results obtained by feeding our product. **They are right in every particular.**

Our Special Chick Food ——is just what young chicks need. It is what they naturally look for.

Our Growing Chick Food ——is a strength giver and body builder. It is the ideal food to bring young chicks to a healthy maturity.

Our Egg Food ——supplies the necessary ingredients for making eggs and keeping laying hens in full vigor.

Our Scratch Food ——gives the flock the variety of grain, etc., necessary for vigor and continued health.

We are manufacturers and distributors of the most perfect poultry food to be had any place at any price. If you will give our foods as directed you will have no trouble in raising chickens for eggs and market.

We Have Solved the Problem For You. Ask For

COULSON'S FOOD.

Insist on getting it if you want the best.

Our goods are sold by all reliable poultry supply houses. If your dealer cannot supply you, write us and we will name our nearest agent.

Be sure to write for our book "Poultry Feeding for Profit." It is instructive and entertaining. Also contains a list of poultry remedies and supplies. Write today for a copy.

FEED AND CARE OF GOSLINGS.

Goslings are not very well able to endure bad treatment when they are first hatched. Why this is so it would be hard to tell, because after three or four weeks there is no more hardy bird among all our domesticated fowls.

Some breeders practice feeding only tender grass for the first two days, giving grain feed afterward. Others feed a mixture of one-third corn-meal and two-thirds shorts, mixed quite dry, with some tender grass as a relish.

Theoretically the grass is a good feed, because the goose is a grazing bird, capable of living and thriving on green vegetation without other feed.

Keep the goslings in a dry, warm place twenty-four hours, or even several hours longer, after they are hatched, without feeding them anything. Then give them the tender grass or the corn-meal and shorts mixture and grass.

If corn-meal and shorts are not obtainable, cracked corn slightly cooked does very well, feeding it very lightly at first, gradually increasing the feed.

Until a week or ten days old keep them in a small enclosure, such as a pen made of boards a foot wide set on edge, moving this every day to fresh ground on which there is a supply of tender grass.

After this give them a large place to run in, feeding a little at a time and often until they are a month old. After this time they may be safely turned on a wide range where they will find pasturage and make rapid growth. Feed them every day and accustom them to being called, so they will come when it is desired to gather them together. It is not necessary that they should have water in which to swim, but a small stream or a pool is much enjoyed by them, and furnishes a place to which they will resort a considerable part of the time, if feed is plentiful, so they need not spend most of the time eating.

After goslings are turned on pasture, if the grass is in good condition it is not necessary to feed them more than twice a day at first and later once a day, as it is not desirable to keep them fat from the start unless they are to be sold as green geese, in which case they should be kept plump from the start and sold as soon as they are ready for the market. There is no profit in keeping a gosling fat if it is to be kept for the Christmas market or reserved as a breeder.

The object should be to get as large a growth of frame as possible, and for this nothing is better than grass alone. Feeding them once a day or once every other day will keep them familiar with the owner and tame enough so they will come at call.—Poultry.

SOME SUGGESTIONS.

Hens that lay soft-shelled eggs may be helped by a little more vegetables or green food and oyster shell.

Young ducks should be ready for market at 10 weeks old. There is no profit in feeding them after that.

Never change to a new breed simply because extravagant claims are given. It is better to try to improve the old ones.

Do not forget that the hens will need plenty of grit to help grind up the food. If plenty of grit is not available, provide it for them.

Treatment for roup—One ounce permanganate of potash to three pints of water for submerging the head. For drinking purposes dilute one pint of above mixture in three or four pints of water.

Made to Meet Coast Conditions

CYPHERS Incubators and Brooders *are by far the best* for use on the Pacific Coast.

Ten years' experience *has proved this!* We have letters from leading, successful poultrymen from one end of the Coast to the other. They all tell the same story of *continuous, high percentage hatches.* Many of these letters, all of them of *late date*, are published in our new 1911 Year Book. It's a big 212-page *guide to poultry profits.* Helpful, practical, inspiring! And it tells all about

Incubators and Brooders

The evidence is conclusive that the PETALUMA is the best Incubator buy that can be made. The best value for the money ever offered and is appreciated most by those who have had varied experiences with other incubators. Why? Because it hatches such large, strong vigorous chicks. More Petaluma Incubators were installed in the large hatcheries last year than all other makes combined. No other incubator in the world has a hatching record to equal the Petaluma.

Write for our Free Catalogue. It is interesting.

Irrigation and Forestry

ROOSEVELT DAM FULLER THAN EVER.

Speaking of the great benefits of the Roosevelt reservoir, the Arizona Democrat says:

The maximum of last year, which was the record to date, was passed today and will far exceed the old record. On April 8, of last year, the elevation reached 125.3 feet, which indicated a stored water supply of 235,440 acre feet. At this morning's reading at 8 o'clock the elevation stood at 125.05 feet, an indicated stored water supply of 227,932 acre feet. Two and one-half feet of water is flowing over the intake dam at Livingstone, 19 miles from Roosevelt, and this alone shows that the record amount was passed at an early hour.

Today, February 6, the residents of the Salt River valley are starting with a larger water supply than was had on April 8 of last year, which was the end of last year's rainy season. This year the rainy season is just beginning and by April 8, 1911, there will be twice as much water in the reservoir as there was a year ago at that time.

The big rains which were general over the territory have brought about this remarkable record which means a prosperous year and thousands of dollars to this section. The reading of Saturday morning, which was taken before the run-off had gotten under way was 116.5, Sunday 119.0 and today 125.05, which shows the rapid rise, an increase in the past 48 hours of 14.4 feet.

Plenty of Water.

An announcement of interest is made today by the reclamation service to the ranchers of the Salt River valley. Last October, the date of the annual sale of winter water, owing to conditions then prevailing in the reservoir, the reclamation service refused to sell water for the class A and class B lands which were not cultivated during the preceding year. They were entitled to water when it could be assured, but if there was a scarcity, the lands in continuous cultivation come first. One of the fine points of the government administration is that it will sell them no water unless it can deliver the goods. Since last October things have changed and Engineer Reed stated today that all those who have class A and class B lands may now buy water, whether they had them in cultivation last year or not.

Meaning of Irrigation Terms.

Hundreds of tourists and new settlers in the city and Salt River valley have inquired recently what is meant by all this uproar over the water proposition, what an "acre foot" means, what is a "miner's inch," and how much water will the reservoir hold, etc.

Acre Foot.

An acre foot is the amount of water that will cover an acre of land one foot deep; or an acre foot is the amount of water that will cover 43,560 square feet, which is the number of square feet in an acre, a foot deep.

Miner's Inch.

A miner's inch is the one-fortieth of a second foot. A second foot is the amount of water passing through a space one foot square, in one second.

Capacity of Reservoir.

The reservoir will hold 1,284,000 acre feet, an amount which would last over four years without any rainfall. The present amount of 227,932 acre feet would easily carry us through this year, if no more flowed into the reservoir and even if no more rain fell in the Salt River valley during the next year.

Last Year Exceptionally Dry.

Last year was an exceptionally dry season and the water supply decreased considerably by the end of the summer. The lowest point reached last year was on November 13, when the water elevation dropped to 56.85 feet, indicating a stored water supply of 16,914 acre feet.

What a Foot Increase means.

A foot increase in the elevation at the present time means about five times as much increase as it would mean when the elevation was lower.

As for instance, the elevation 64 feet means 24,773 acre feet, and at 65 means 26,026, showing a one foot rise to mean an increase of 1,253 acre feet. An elevation of 125 feet means 227,632 acre feet, and the 126 mark indicates a supply of 233,648 acre feet, which shows a foot increase now is equal to about 6,016 acre feet, against an increase of 1,253 acre feet when the elevation stood near the 60-foot mark.

Four Acre Feet Per Year.

Approximately four acre feet of water is used per year on one acre of land. At the present time the reservoir supplies water for irrigation purposes to 131,364 acres, which includes the Tempe irrigation lands.

When ex-President Roosevelt comes here in March he will not only see a rapidly growing section of the southwest, but also the reservoir which bears his name, containing the greatest amount of water in its history.

There is much rejoicing around the reclamation offices today and throughout the Salt River valley. The fact that the maximum amount was reached today is cause for rejoicing.

A Few Facts.

The great Roosevelt dam is about 70 miles northeast of this city and will be dedicated on March 18 of this year. Ex-President Roosevelt will have charge of the dedicatory exercises. Some facts about the dam follow:

It is 1800 feet long, 280 feet high and contains 326,000 cubic yards of masonry.

The reservoir will be used in a short time to irrigate a total of 240,000 acres of land.

The dam was erected in the course of five years and will cost the government about $8,540,000.

"SUCCESS" INCUBATORS

We Pay the Freight.

Buy from me at wholesale prices
INVESTIGATION is all I ask.

Which would you rather do, buy from a company that sells through agents and tacks on 25% to the real value of the Incubator or buy from me at first cost? Any company that sells through an agent has to give them 25% to 35% of the price, or they would not sell the goods; that is plain. I do not sell through agents. I keep no books, sell to no one on credit, have no losses for you to have to stand a part. I sell to you at wholesale. My price list proves it. I sell a hot water, three-pipe system machine, double walls, double top, slatted egg trays, compound heater, complete with removable nursery drawers, stained mahogany color with three coats shellac, and then pay the freight on the machines. I can do it and still make a profit. I own my own buildings, pay no rent, use no high priced useless office help, and everybody works. If you are with me, get my free book today, 48 pages. It tells the story. Our 64-page Pioneer Hatchery book tells the story of the largest baby chick concern in the world. It's worth while. Send your name to me today.

60 Egg size, $9.00
130 Egg size, $14.00
360 Egg size, $25.00
612 Egg size, $40.00
WE PAY THE FREIGHT

Experience
I can show you quick where we get it, when you get my book. My business doubles year after year, because I make good Incubators and sell at the right price.

We hatch 100,000 eggs every 21 days.

My heaters cost MORE
Than any other hot water heater used on any Incubator whatsoever. It has three pipes, hot water goes around the outside of the case first and returns through the central pipe. The copper boiler on the 612-egg size is 10 inches long; no other is made that long, and three pipes cost more than two. No hot air Incubator on earth will run as even as a first-class hot water Incubator.

Everybody knows
THAT EVEN HEAT and the RIGHT amount of warmed fresh air is what hatches eggs. This can be had in a "SUCCESS" Incubator just the same as in any other well-made redwood case labeled Incubator. Don't think because some companies use a pretty label and a big price that you will get any more value than in the "SUCCESS" Incubator which I sell at these very low prices.

Heavy Fence
For Economy

WOVEN-WIRE FENCES must be heavy as they have to turn animals by sheer strength of the wire. A fence with barbs is protected from excessive pressure because the animal fears the barbs. Remove the barbs and the greatest strength of the animal is thrown upon the fence. Its wires must be larger and stronger. To have a long-life woven-wire fence the fence must be heavy.

AMERICAN FENCE

is a thoroughly galvanized square mesh fence of weight, strength and durability. Large wires are used and the whole fabric is woven together with the American hinged joint (patented)—the most substantial and flexible union possible. Both wires are positively locked and firmly held against side slip and yet are free to act like a hinge in yielding to pressure, returning quickly to place without bending or injuring the metal.

Dealers Everywhere—Stocks of American Fence are carried in every place where farm supplies are sold. The Fence is shipped to these points in carload lots, thereby securing the cheapest transportation, and the saving in freight thus made enables it to be sold at the lowest prices. Look for the American Fence dealer and get the substantial advantages he is enabled to offer. He is there to serve the purchaser in person, offer the variety of selection and save the buyer money in many ways.

Questions and Answers

THE EDITOR AND STAFF

Questions to be answered in this department should be received at this office one week before reply is expected. Write plainly on one side of the paper and sign full name and address. Unsigned communications receive no attention.

Grafting Walnuts.

Please describe in Cultivator grafting of walnuts. I have access to an expert grafter, but he does not seem to succeed with walnuts.—Subscriber, Mesa Grande.

We would refer our subscriber to issues of The Cultivator of February 16th this year and February 17th, 1910. The former mentioned article gives Mr. Roeding's method; the latter, Mr. Neff's. Both are illustrated with good engravings.

Duroc-Jerseys.

Can you give within easy shipping distance of Turlock the name of breeder of Duroc-Jerseys? — Subscriber, Turlock.

Duroc-Jersey breeders in this state, if there are many of them, are exceedingly backward in announcing themselves. We imagine there are but few in California.

Grafting.

I am surprised to note in a recent Cultivator that the originator of the graft described and illustrated in the leading article, is Mr. Roeding of Fresno, also to see it described as a late method, as I practiced it for ten years in Ohio and advocated it in 1906 at an institute conducted by Mr. Fowler at Acampo. I think you should give the "effete East" its due. I enjoy The Cultivator very much.—J. F. Callahan, Redlands.

Measuring Water.

Please tell me how to measure water from an artesian well.—Subscriber, Oxnard.

We regret that our issues of March 9th, 1909, and March 31st, 1910, both of which contained tables and instructions for weir construction and for measuring water, have been exhausted. As soon as possible these will be reprinted for the benefit of this and other subscribers.

Weeds in Young Alfalfa.

I sowed some alfalfa last fall and have a very good stand, but the wild oats and other weeds are very thick and high all over it and the little alfalfa does not seem to grow much in it. I intend to mow it but a neighbor of mine has some in the same condition and mowing did not seem to help it, as the wild oats is growing up again. I should like to have your advice as to what to do with it. Will the wild oats and weeds mature and die or keep on growing under irrigation and kill the alfalfa.—M. W., Lindsay.

Mowing of these weeds will probably keep them down so that the alfalfa will get a start. The wild oats is an annual and we presume the others you mention simply as weeds are also. Of course, if you have Bermuda or similar pest to contend with, the matter is more serious, but with the annuals kept mowed, the alfalfa will take a start as soon as warm weather comes and will probably give you a good stand.

Pruning Red Emperors.

I wrote Mrs. Sherman last year asking for advice in pruning Red Emperor vines, which she kindly furnished me. The vines were about three years old and I staked all of those that were long enough to a stake five feet in height, running one long cane to top of stake with the intention of forming the head there as per instructions. Results were very satisfactory and I got a nice crop; in fact, they were the first Red Emperors to furnish a crop in San Diego county so far as I know. For this year on those that I staked five feet high last year, will try to form the head at top of stake and to leave good laterals all the way up vine, two to three buds to each lateral. Shall be greatly obliged if you will let me know whether this is correct as I know of no one else who is so well informed on the subject.—J. J., Escondido.

I am glad you made good with the pruning and you have the correct idea of forming the crown at the top of the stake. Now in pruning the side laterals to spurs, there is one thing to observe, that is to keep them going around the stake; that is, cut if possible to buds that point in the right direction so that the spurs do not stand out, in time, a foot or so from the vine, but while they may be that long it is in close to the stake. This is one reason why one cannot say cut to so many buds exactly on these spurs.—M. E. S.

Olive Oil.

Can you tell me some way by which I can make my own olive oil for home use —Subscriber, Kaweah.

It is not practicable to manufacture olive oil in small quantities. The process requires weeks and even months and the number of utensils and the conditions under which the oil must be kept to ripen are all against the process in this small way. In a word, the method is to crush, press, allow the oil to separate from juice and such pulp as passes through the press, racking off the oil, clarifying, filtering, ripening, again filtering and bottling."

Nectarines not Bearing.

Do my nectarine trees need spraying? They are four years old and so far have never had ripe fruit. Fruit drops when about the size of a cherry. No curl leaf bothers them.—Subscriber, Redwood City.

We cannot give any very definite treatment for this trouble. We would, however, spray with the sulphur-lime or Bordeaux solution. This can do no harm and would correct any possible fungous trouble. If trees do not bear this season it is possible that summer topping would cause setting of stronger fruit buds for the next crop. Citrus growers have been applying to soil nitrate of soda at blossoming time in order to give more strength to the tree for the young crop. We have never heard of this being used on deciduous trees, but if we had this orchard we would do a little experimenting along that line. We should be pleased to hear from the inquirer after the setting of this crop if any experiments are made.

Homesteading.

Can a citizen (ex-soldier) obtain government land in California under the homestead act? How long does it take to prove up? Can it be taken up in the forest reserve? What would be the actual cost? Where can I obtain printed information relative to this subject?—G. H. G., Carpinteria.

Any citizen of the United States or one having filed intention of becoming a citizen, can obtain government land under the homestead act if he has not exhausted his right by other filing. There are also certain other exceptions, such as a married

woman, unless deserted by her husband or he is incompetent; ownership of more than 160 acres of land, etc. It takes five years to prove up excepting in the case of ex-soldiers, whose time of service during the Civil war or the Spanish-American war is deducted from the five years. He cannot take up land within the forest reserves. There is no other cost for homesteading than filing fees which are merely nominal. The best information can be obtained by writing to the nearest land office, in this case, Los Angeles, and asking for "Suggestions to homesteaders and persons desiring to make homestead entries," issue of Sept. 24, 1910.

Trespassing Stock.

My neighbor has an unfenced grain field, adjoining my farm. He sowed grain while I was away for the day and as my chickens were not fenced in they got on his grain field, with the result that he shot some of them. Is he not liable to me for the amount of my loss? He had not notified me of his intention to sow grain, and the land was not cultivated last year. I was perfectly willing to keep the chickens penned up, for I did not wish a neighbor's crop molested, but I think that he took an unfair advantage. I have them fenced now. Had he the right to kill my stock?—V. B. B., Highland.

Under the present law unless a field is surrounded by a "substantial fence," trespassing stock, which means poultry, of course, cannot be held accountable for damage done, that is, the owner of field must fence against other people's stock. This is unjust, but it is the law and will be until the new one which is now being pressed in the legislature is signed, if it passes. But under any law the destruction of trespassing stock is not justified, and you have a claim for damages. The only counterclaim which could be put up is for damage caused by stock, and, as we say, under the present law that would be nothing.

Olives That Bloom With the Mission.

Answering a former query: In Southern California we would plant Rubra for cross pollination of the Mission, but in Northern California we would plant Ascolina. Rubra is a good oil olive and a prolific bearer in the south, while the Ascolina is a shy bearer. In the north, any kind of olive will bear every year if properly pruned.—J. W. M.

Bitter Milk.

Cow was sick from feeding musty hay, but got all right as far as I could tell, but her milk became bitter about seven or eight weeks before she calved. She has been fresh about eight weeks, but her milk does not sour and butter when churned from cream 48 hours old has an odd taste. —W. L. K., Lemon Grove.

We do not think the bitterness comes from condition of the cow, more likely the cause is bacterial. We would refer the inquirer to Mrs. Sherman's answer to another question in the last issue, headed "Stringy Milk."

Cucumbers in Brine.

What is the best way to treat cucumber pickles now in brine to make them into sour pickles? What is the best kind of vinegar to use?—J. B. L., Kingriver.

When wanted for pickling, remove from brine, taking off weight and board, carefully lifting cloth with scum on it. Wash all clean and wipe all scum off cucumbers and sides of cask. If not all are removed from the brine at once, return the cloth, board and weight and cover closely. Place the cucumbers in a vessel large enough to hold two or three times as much water as there are pickles, cover with cold water (some use hot), change the water each day for three days, place porcelain kettle on fire, fill half full of vinegar (if vinegar is very strong add half water) fill nearly full of cucumbers, the larger first, then the smaller ones, put in a lump of alum the size of a nutmeg, let come to a boil, stirring with a wire or wooden spoon so as not to cut the cucumbers; after boiling one minute, take out, place in a stone jar, and continue until all are scalded, then pour over them cold vinegar. In two or three days, if the pickles are too salt, turn off the vinegar and put on fresh, add a pint of brown sugar to each two gallons pickles, a pod or two of red pepper, a very few cloves, and some pieces of horseradish. The horseradish prevents a white scum from rising. The best vinegar is made from pure apple cider.

Bugs in Peaches.

I was greatly troubled last season by bugs in my peaches. They are black, a quarter of an inch long, and very small. They start at the stem and work into the peach. I have the two varieties of Crawfords, the early not being affected. Will spraying do any good?—J. H. C., San Bernardino.

This was referred to Horticultural Commissioner Pease of San Bernardino county who writes that he has never heard of this trouble unless it be the small bugs which find entrance to the pit in peaches that split badly. In such a case the bugs enter and might be considered the cause, which they are not. What causes splitting of peaches is unknown though there has been much investigation to determine it. We do not believe that spraying would have any effect.

Georgia Yam.

Where may I secure white sweet potatoes or Georgia yams for seeding? I wish potatoes free from disease. Also, where can I secure reliable information on sweet potato culture?—Subscriber, Ontario.

Mr. W. W. Burford of Glendale, and the Aggeler & Musser Seed Co. of Los Angeles can supply you with plants of white yams and possibly may sell you the potatoes. Also it is probable that other seed houses advertising in The Cultivator can do the same. Former issues of The Cultivator have contained much information about sweet potato culture, as does Wickson's California Vegetables. We do not know of any publication given entirely to sweet potato culture.

Cyclamen—Poppies—Nasturtiums.

I purchased a number of Cyclamen plants in full bloom from a florist. Can I set them out in the ground when they cease blooming, or what shall I do with them? Can you give me some advice as to their care and habits? Does the root of the cultivated California poppy remain in the ground through the winter and come up in the spring the same as the wild plant, or must I sow seed every spring? When can I plant nasturtium seed, and do they require a rich soil? Is decayed leaf mold as good for a flower garden as barn manure? Can one use fresh hen droppings, or such as are in a dry condition, in the flower beds? —Subscriber, Los Gatos.

Cyclamen may be planted in open ground from the pot as soon as done blooming. Treat as you would ferns or other shade loving plants.

California poppies will remain in bloom if supplied with water through the summer. They are so easily reproduced from seed, however, and the young plants give so much more satisfactory flowers, that it is better to

WINSEL'S GARDEN CALENDAR

FOR THE MONTH OF MARCH

FRUIT TREES. Plant Oranges, Lemons, Grape Fruit, Loquats, Guavas and all evergreen fruit trees. Send your orders to 211 South Main Street, or visit our nurseries, S.W. Cor. Washington and Figueroa Streets, Los Angeles, and select your trees.

FIELD GROWN ROSES. Two years old. These plants were lifted from the open ground the first of the year, and are thoroughly established now in 6-inch pots. We have a complete assortment of varieties best adapted to Southern California. Price 35c each, $3.50 per doz. We prepay freight to any point in Southern California on orders of one dozen or over. Send for our rose list.

VEGETABLE GARDEN. Sow Beans, Peas, Sweet Corn, Cucumbers, Melons, Squash, Beets, Carrots, Cabbage, Lettuce, Parsnip and Radish. Our Peas, Beans and Sweet Corn are of the best Northern grown stock. All our seeds are raised by the best specialists in their line.

Plant Onion Sets and the roots of Rhubarb, Asparagus and Horseradish, and set out the plants of Cabbage, Cauliflower, Shives, Tarragon, Pepper, Tomatoes and Celery. We have a good supply of all these plants on hand.

LAWNS. Put in your lawn with our Kentucky Blue Grass and White Clover seeds. We carry the best grades only.

FLOWER GARDEN. Sow the seeds of Asters, Sweet Peas, Coreopsis, Centaurea, Alysum, Poppies and Pinks. We have on hand the following plants that can be set out now: Gaillardia, Verbena, Pansies, Violets and Stocks, at 25c per doz., $1.50 per hundred.

SHEEP MANURE. Free of weeds and odorless. Gives immediate results. Delivered anywhere in Los Angeles, Pasadena or Hollywood at $2.25 per hundred pounds.

LANDSCAPE GARDENING. Estimates and plans furnished.

OUR FREE NEW CATALOG. Giving directions how and when to plant everything. Tells about flowers, vegetables, fruit trees and ornamental stock, and also contains a plan for a semi-tropical garden, and how it should be planted in Southern California. The only book of its kind free for the asking.

Winsel's Seed Store

OUR NEW LOCATION:
211 South Main st., near Second, Los Angeles, California

sow repeatedly than to treat as perennial.

Nasturtium seed may be planted at almost any time from this on except in sections where there is danger of late frost. They do not require rich soil, and if it is very rich the plants go almost entirely to rank vines. Decayed leaf mold and stable manure have similar effect on soil, but of course the stable manure is far richer in plant food, especially in nitrogen, of which leaf mold possesses practically none. The leaf mold lightens and helps mechanical condition of soil. Fresh poultry manure must be used very cautiously. Do not get near roots of plants. It is well to compost with soil and coarser, less condensed fertilizer, then wait till at least partially decayed.

Black Spot in Oranges.

What causes the Navel orange to have black spot, usually at the navel end? Often there is a small round hole in the skin with web over it, and the opening sometimes has a worm in it and always looks as if a worm had entered. The spot inside has the appearance of dry rot. Is there any remedy?—T. J. L., Alhambra.

Our subscriber seems to have two separate troubles in mind. The hole with the small web over it is caused by the larva of an insect, while the navel end rot is from another cause. On this point Dr. J. Eliot Coit of the Pathological Station writes:

"In regard to the black spot, or navel end rot of the orange, I will say that the remedy is to destroy, preferably by burning, all affected oranges, including those which dropped off under the trees, and in this way prevent to a certain extent the fruiting of the fungus and wide dissemination of the spores. A remedy of this kind is of course most effective when all growers of a section co-operate. I would also suggest that in the case of the orange worm, Tortrix citrana, the same method of gathering the infested fruit and destroying them is recommended."

Veterinary

Answers in this column by Dr. Fred G. Matthews, are without charge. For immediate mail answer remit $1.00. In writing questions give full symptoms or particulars of injury of animal.

Lice on Horses.

I have several horses which are troubled with lice. Kindly advise a remedy.—Subscriber, Newcastle.

To five quarts of water add a half pint of creolin; mix till a uniform solution is obtained; and sponge the affected animals with the solution. After about ten days examine the horses carefully and repeat the treatment if young lice are found.

Scours.

In a recent issue of The Cultivator gallogen was recommended for scours in horses, but the druggist to whom I applied has no knowledge of the drug. Where can I secure the remedy?—W. E. K., Azusa.

Gallogen, an intestinal astringent, is listed by Merck & Co., and drug houses in New York, which offer it prepared especially for veterinary use. Tannoform may be substituted for gallogen and may be less expensive. The dose is two drachms three times daily.

THE END OF THE AUTOMOBILE.

Treating upon the subject that the automobile is the evil spirit of hard times and high cost living, the editor of "The Lever," a Chicago publication, sums up the situation as follows:

The automobile was an inevitable outcome of an epoch which conceived a telephone, a telegraph, a harvester, an airship and a turbine.

We have ended the search of alchemy. The world's supply of gold is in the sands of the hour-glass. Time is money.

When men can stretch one minute into two, expenses become halved and profits doubled.

We have set up a vast and irresistible machine to squeeze centuries into decades.

We have built it with wires and Leyden jars and armatures—with Titan cranes and caissons and steel rails.

But no cog in all the mass of whirling, swirling parts, is more vital than that which will condense distance for the individual.

We are outbreeding our food supply. We must break grounds in the wilds—the farmer must have a longer stride. He will not land where he cannot profitably and comfortably reach a shipping point.

Acreage out of the zone of traffic is as useless as a garden in the Sahara.

The automobile means a doubled agricultural area within the next ten years.

Its gasoline is a mile-shrinker. It enables the producer to operate twice as far from the town as his mule-team or Percherons could ever have permitted him.

It solves the problems of sequestration and turns ranches twenty miles apart into neighborhood backyards.

It banishes the loneliness of the women—the unutterable heart-aching, mind-breaking desolation which in another day filled insane asylums with demented wives and mothers.

It locates a school house around every corner.

It is sending new sons to the soil and keeping the farmborn at the plow.

It has set a hundred thousand mechanics at the lathe—given employment to more than a million men, at a better wage than the same labor hitherto yielded, and simplified the long baffling tangles of transportation.

But if it has done none of these things—if all its utility—all its productivity were naught—it has made a newer and a stronger and a keener generation.

It has crooned the Song of the Road to an over strained and neurotic and tired commonwealth—lured a wan and worn people to the field and forest—carried them out of the moil and toil into a saner and cleaner life.

RECENT DEVELOPMENTS IN THE NITROGEN QUESTION.

By E. S. Mather.

Scientists and bacteriologists in various parts of the world have been for many years interested in discovering new methods of producing nitrates to replace the rapidly diminishing supply and insure the world against gradual starvation. Without nitrates, the plants on which we depend for our food supplies cannot live.

For our supply of nitrates in the form of nitrate of soda, we are obliged to rely on the saltpeter deposits in Chile, and so great is the demand for this material that the most available portions have already been used up, and the rapidly increasing cost of production will soon place what little remains beyond the reach of the agricultural world.

Let us turn, therefore, from the most interesting manufacturing phenomena, and consider the wise provision that nature has made for just this emergency, namely, the fixation of nitrogen by bacteria, on the roots of legume crops. For in this method lies the solution of the problem, and the next generation will marvel at the folly of their fathers in expending large sums of money for material that could be abundantly supplied almost for the asking.

The discovery of the value of treating the seeds of legume crops with nitrogen fixing bacteria, as a means of enriching the soil in nitrates is not new, but like many great discoveries, its general practice has been greatly retarded by crude methods and premature exploitation, which has prejudiced the minds, not only of farmers, but of the very men in the agricultural experiment stations and colleges, to whom the farmer turns for advice.

The necessity of inoculation is well recognized by the best authorities today, but recognition of the advantage of using pure cultures of high-bred bacteria for this work is apparently retarded by suspicion of commercial cultures and lack of knowledge of the methods employed in their production.

When the bacteria have been grown in a non-nitrogenous medium directly on the roots of the plants, they are to be used for, their potency is greatly increased, and all the attendant dangers of the soil transfer method are done away with.

The many failures to secure results from inoculation of seeds were largely due to three causes: First, to lack of attention to the great importance of breeding the organisms to secure the strongest and most virile specimens. Second, to crude methods of sending them to the user, and keeping them alive until they could be put on the seeds. Third, to lack of knowledge of necessary soil conditions for their proper development.

These difficulties have been overcome by Dr. G. H. Earp-Thomas, and he is sending to seed houses for distribution to the farmers from his laboratory cultures of high-bred bacteria that are guaranteed to keep in perfect condition for long periods of time, and require no further development on the part of the user. The bacteria are simply put on the seed, and nature takes care of the rest. In selecting bacteria for breeding purposes, it is, of course, necessary to watch the development of the different colonies on the roots of the legumes, and it would be manifestly impossible, when working with plants (under ordinary conditions), to pull them up every day to examine them. It was the discovery of a transparent jelly so delicately balanced, that it would furnish a perfect food, that made this work possible. This jelly contains no nitrates except those produced by the bacteria on the growing roots.

Experiments carried on by one of the state experiment stations proved that these high-bred cultures would produce from one to four hundred per cent more nitrates than those usually found in the soil. It is also true that the increased activity of the bacteria means quicker production of nitrates, and an ample supply of this most essential material during the early stages of the growth of the plant.

Having procured the means of breeding pure active cultures it became necessary to devise some means of preserving them, until such time as they could be used. The earlier attempts of the U. S. department of agriculture, and other people to send the bacteria dried in cotton, had not proved successful, and the bacteria when sent in a liquid preparation in sealed bottles, soon lost their vitality from lack of atmospheric nitrogen.

Were it possible to keep bacteria in good condition in a liquid medium there would still be strong objection to this method, as it is impossible in such preparations to detect the presence of moulds and other contaminations that are dangerous to the nitrogen fixing bacteria. The value of all cultures of bacteria depends very largely on their purity and freedom from contamination. This method of growing cultures on the surface of the jelly in the bottles in which they are sent to the user enables him to easily detect imperfections and prevent their distribution.

The invention of a bottle stopper which admits a supply of air through a glass tube containing filter plugs, that keeps out contaminations, yet is so constructed as to prevent the escape or evaporation of the contents of the bottle, is not simply an ingenious device, but a remarkable contribution to the art of preserving bacteria and protecting the cultures from destructive contamination. The development of these methods and processes means that another of nature's forces has been harnessed for the benefit of mankind, and the question of maintaining the supply of nitrates in the soil is finally solved.

To secure the best results from the use of nitrogen fixing bacteria, some consideration must be given to the conditions of soil that are most favorable to their growth, and the most important is the question whether the land is acid or alkaline.

The development in the land of beneficial soil bacteria of various kinds is to a great extent dependent on proper chemical conditions. Microscopic examination of soil and the determination of the kinds of bacteria that are found therein, will tell the story of its fertility more surely than chemical analysis, as the presence of some forms of bacteria is a sure sign of its productiveness, whereas, other kinds indicate improper conditions that must be corrected if good results are to follow. It has been found that highly productive land contains large quantities of beneficial bacteria, whereas, poor soil is deficient in this respect, but often contains large quantities of organisms that are known to be injurious in their effect on plant life, and destructive to the nitrogen fixing bacteria. The protozoa, and the various forms of fungi yeasts and anacrobes belong to this class. Science has not yet determined the practical means of exterminating all of these forms, but much has been learned about conditions that are favorable to the nitrogen fixing bacteria and this knowledge is available to every farmer. Good drainage and cultivation are well known requisites for good farming, but the beneficial effect of lime may not be so well understood. Bacteria cannot fix nitrogen in the soil without some base with which it can be combined, and lime is by far the cheapest material that nature has provided for this purpose. Lime also has strong chemical action, and neutralizes the acid conditions of the soil. Land that is acid or sour is fatal to the growth of nitrogen fixing bacteria, and the corrective influence of lime is most valuable. The use of green manure and fertilizers makes the application of lime absolutely essential. Heavy soils require more than light soils.

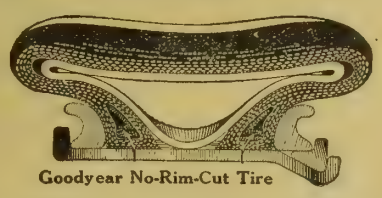
Loss of nitrogen in the soil is often the result of denitrifying bacteria which exist in heavy wet soils and decaying organic matter. Such conditions can be prevented by proper drainage and the application of lime to lighten the soil, and put it in proper condition for the growth of legume crops that have been inoculated with pure cultures of high-bred bacteria.

Ask for Our Tire Book
Cut Tire Bills in Two

Probably 100,000 motor car owners now use Goodyear No-Rim-Cut tires—10% oversize.

The control of this tire jumped our tire sales last year to $8,500,000. And 64 leading motor car makers have contracted for these tires this year. They now outsell our clincher tires almost six to one.

If you are a tire user you should know these tires. They cut tire bills in two. Ask us to mail our Tire Book.



Goodyear No-Rim-Cut Tire

The No-Rim-Cut tire—like the clincher tire—fits any standard rim for quick-detachable tires. Also demountable rims.

In changing from clinchers, you simply slip each removable rim flange to the other side. Then the tire comes against a rounded edge, as shown in the picture above.

We have run these tires flat in a hundred tests—as far as 20 miles—without a single instance of rim cutting.

Ordinary Clincher Tire

With the ordinary tire—the clincher tire—these removable rim flanges must be set to curve inward—to grasp hold of the hooked tire base. That is how the tire is held on.

The picture shows how the thin edge of the flange then digs into the tire. That is the cause of rim cutting. That is what ruins a tire beyond repair if you run it not fully inflated.

More damage is done by rim cutting than any other single cause. To avoid it means an average saving of 25 per cent on tires. We do avoid it utterly in Goodyear No-Rim-Cut tires.

The Secret

The reason lies in 126 braided piano wires which we vulcanize into our tire base. That makes the tire base unstretchable. Nothing can force it off of the rim until you unlock and remove the rim flange.

When the tire is inflated these braided wires contract. The tire is then held to the rim by a pressure of 134 pounds to the inch.

That's why No-Rim-Cut tires are not hooked to the rim. That's why the rim flanges can be turned outward. Not even tire bolts are needed.

We control this feature by patent. All other methods for making an unstretchable tire base have been found deficient. Single wires or twisted wires won't do. The braided wires which contract under air pressure are essential to a safe hookless tire.

GOODYEAR
No-Rim-Cut Tires

Tires 10% Oversize

When the rim flanges curve outward, the extra flare lets us make these tires 10 per cent oversize. And we do it without any extra charge.

This adds 10 per cent to the carrying capacity—10 per cent to the air cushion. It takes care of the extras—the top, glass front, gas tank, extra tire, etc. It avoids the overloading which is almost universal without the oversize tire.

This 10 per cent oversize, with the average car, adds 25 per cent to the tire mileage. These two features together—No-Rim-Cut and oversize—are saving thousands of motorists about half on their tire bills. Nothing else invented in late years saves so much on upkeep.

Yet these patented tires—which used to cost one-fifth extra—now cost the same as other standard tires.

Our Tire Book explains things fully. It tells all we have learned about making tires in 12 years spent in tire making. It tells how you can reduce your tire bills to a trifling sum.

It is time that every motorist knew these facts. Please write us to mail the book.

Timely Ranch Suggestions

THE CALIFORNIA GROUND SQUIRREL.

By C. Hart Merriam, Consulting Biologist U. S. Dept. Agr.

Ground squirrels are among the most destructive of our native mammals, causing losses to agriculture amounting to upward of ten millions of dollars each year. Most of the western states are overrun by them. California is no exception, having within its borders not less than three genera and a dozen species. Of these the most important in its relation to man is the large gray species variously known as the California, Digger, or Beechey ground squirrel (Citellus beecheyi). It is about the size of the eastern gray tree squirrel and like it has upright squirrel-like ears and a long bushy tail.

It has two near relatives—the Douglas ground squirrel (Citellus douglasi), which ranges from the north side of San Francisco Bay northward to the Columbia river; and the Rocky Mountain or Plateau ground squirrel (Citellus grammurus), which in California is known only from the canyons of the Colorado river and the Providence Mountains on the east side of the Mohave desert.

The California ground squirrel, because of the extent of its range, which covers the greater part of the agricultural lands of the state; because of the magnitude of the losses it causes by eating grain, nuts, fruit, and other crops; and because of its dangerous character as a carrier and disseminator of bubonic plague, is, of all our species, the one of greatest consequence to man. The danger to human life by the spread of plague so far exceeds in importance the harm done by the destruction of crops that the duty of checking its increase is no longer merely of local interest but has become a matter of national concern.

Range.

The California ground squirrel ranges from Lassen Butte and Susanville in northeastern California southward, east of the Sacramento Valley to San Francisco Bay, and south of the bay overspreads practically the entire state and pushes southward into the peninsula of Lower California, avoiding only the higher mountains and the more arid deserts. Its handsome subspecies, fisheri, inhabits Kern and Owens valleys, the borders of the Mohave desert, the upper parts of San Gorgonio Pass, and other localities in Southern California, and occurs as far east as the Coso, Argus, and Panamint mountains.

Habitat and Home.

The Beechey ground squirrel abounds along the ocean shore from San Francisco southward; it inhabits the open plains of the great interior valley of California, the grassy chaparral slopes of the foothills, the rocky walls of canyons, and in places the more open parts of the yellow pine forest of the mountains. It lives in underground burrows which usually are grouped in colonies. The colonies may be located on bare open plains, on the grassy slopes of foothills. or about the roots of trees—particularly the great valley oaks with hollows in their trunks and limbs. The burrows vary in number from a few to hundreds, and by the union of continuous colonies sometimes reach a total of thousands and cover almost continuously many hundreds of acres. In places they are so near together as to fairly honeycomb the ground. Well-beaten paths, 2½ to 3 inches broad, lead from burrow to burrow and radiate to the adjacent feeding grounds. Many of them extend for considerable distances and by intersecting form a conspicuous network. The earth brought up from each bur row is deposited at its mouth to form a gradually enlarging hillock, and col onies on the plain may be recognized at a distance by the mounds.

Habits.

The animals are diurnal, and in the larger colonies hundreds may be seen at a time, some scudding swiftly over the ground, some rolling in the dust, some basking in the snushine, and some standing erect on their haunches gazing over the country or biting off the stems of grain, tarweed, or other plants on whose seeds they feed. The seeds not eaten on the spot are tucked away in the cheek pouches and carried to underground storehouses for future use.

While living mainly on the ground the squirrels are good climbers, and are often seen in oaks and other nut-bearing trees and also in fruit trees and tobacco trees.

They are not migrants in the proper sense of the word, their journeys being limited to short distances, as from one locality to a neighboring one, according to the season and fluctuations in the food supply.

This species does not hibernate, except in the mountains, although in the foothills and valleys the animals usually stay in their burrows during stormy and severe weather.

Breeding.

The time of breeding varies somewhat with the locality, animals living in the north, in the mountains, and along the coast breeding later than those in the hot country. The young are usually born in March or early April. Pregnant females have been killed at various dates from February 15 to May 12, and in the farm country young old enough to run about are usually common in April. Now and then small young are seen as late as the middle or latter part of August, indicating that they were born in late June or early July. Whether or not these are cases of a second litter is not known. The number of young at a birth varies from 5 to 11. The average number over the greater part of the state is 8, but along the borders of the Mohave desert it appears to be reduced to 6 or 7.

Food.

The food consists, according to season and locality, of acorns, fruits, seeds of various plants, and green herbage. Acorns are a favorite food and where obtainable are gathered and stored in large quantities. The same is true of manroot (Echinocystis fabacea), the seeds of which are eagerly eaten, according to Piper, from the time they begin to form until fully ripe. At Modesto the squirrels were eating them as early as the middle of May and as late as the middle of December. Other favorite seeds are those of elderberry (Sambucus), jimson weed (Datura), wild nightshade (Solanum), turkey mullein (Eremocarpus), tarweed (Madia), and numerous grasses. Of cultivated nuts,

almonds and walnuts are preferred; of other crops, apples, prunes, peaches, apricots, figs, olives, certain garden vegetables, the seeds of cantaloupes, watermelons, and citron melons, and all the grains are eaten wherever they are to be had, and green alfalfa and clover are sometimes taken. In November—sometimes earlier, according to the date on which the early rains begin—tender green vegetation becomes abundant, and tne ground squirrels turn their attention to it. At this season their chief food consists of green stuff, mainly young wild oats and filaree, the latter a small member of the geranium family widely distributed in California and valued as a forage plant. In several localities in March the cheek pouches examined by Piper were filled with the yet green seeds of filaree. In June the pouches are often filled with alfalfa leaves and flowers. In Southern California the squirrels are fond of the fruit of the prickly pear (Opuntia).

Storing Food.

Ground squirrels carry, in their ample cheek pouches, acorns, olives, various seeds and grain, and even green stuff, from the places where the acorns and seeds are stored for future use. At Modesto in May, 1909, Piper found stores of alfilaria seeds packed in cavities and well mixed with dry sand. In December of the same year he examined a number of stores of grain unearthed by a farmer while scraping and leveling his land. Each of these caches consisted of from a pint to a quart of oats stored in cavities and packed in dry sand. They varied from 8 to 18 inches in depth beneath the surface; some were in short blind holes; others at the ends of branches of the main burrow.

Depredations.

It is easily seen that an animal so large, so abundant, and so generally distributed over the agricultural parts of the state is capable of inflicting serious losses; and when it is remembered that the ground squirrel feeds on walnuts, almonds, apricots, peaches, prunes, apples, olives, figs, oranges, certain vegetables and forage crops, and all the grains, and also damages vineyards and young orange groves, the magnitude of its depredations, amounting to hundreds of thousands of dollars annually, can be readily appreciated. Ground squirrels are particularly fond of green almonds and of the pits of green peaches and apricots, eating these from the time the kernel begins to form until the fruit is ripe, thus doing serious damage. They are very destructive to apples also, and in places in the foothills of the Colfax-Auburn region are said to take fully half the crop.

At times they injure both almond and orange trees by gnawing the bark. In the orange groves between Porterville and Springville, in Tulare county, it is reported that they occasionally gnaw the bark of the orange trees and sometimes cut the fruit and carry it off. They attack drying prunes and carry off large quantities.

But the principal money loss attributed to ground squirrels results from their depredations on grain. They devour barley, wheat and oats when the seed is first sown; they dig up and carry away the sprouting kernels; they invade the fields of ripening grain and feast upon it continuously until harvest time; and when it is cut and stacked they concentrate about the stacks and attack it vigorously, eating all they can and laboring tirelessly to carry the remainder to their underground storehouses. At a single stack near Jamesburg, in Monterey county, a few years ago 300 ground squirrels were caught in traps and many more poisoned; and in July, 1907, Vernon Bailey saw fully 200 about a barley stack at Capistrano, in Orange county. They climbed to the top of the stack and dragged down the grain until it formed a windrow 2 or 3 feet high. At the same place two years later S. E. Piper counted 158 squirrels in sight at one time.

Another kind of injury inflicted by ground squirrels results from their habit of burrowing in embankments. In the flat country they seek small elevations from which they can better observe the approach of their enemies. Dikes, levees, roadways, and embankments of all kinds attract them and are often seriously undermined by their burrows. In the irrigated districts their underground tunnels, like those of the pocket gophers, frequently cause breaks costing large sums to repair. Thus in May, 1910, ground-squirrel burrows caused such a serious washout in the Turlock Canal in Stanislaus county that the line of the canal had to be changed at a cost of $25,000. The break occurred during the latter half of May, and the labor of rebuilding the waterway occupied about three months, depriving the ranchmen of water at the very time it was most needed for the irrigation of their alfalfa and other products and entailing a loss of upward of half a million dollars.

SMELTERS' TROUBLES.

Continuous disputes and lawsuits between farmers and smelting companies are evidence of the increasing damage done by the poisonous fumes from the smelters as the population increases. The smelting of many ores, and especially those of copper, volatilizes the arsenic or other poison in combination with the ore, which is sent off in sufficient quantity to injure and ultimately kill all the vegetation, especially on the side opposite to the prevailing winds, for miles around. As the result of suits in many states, it has become settled law that smelters cannot be operated unless this destruction is prevented, and their owners are at their wits' end. The problem is to conduct the fumes from the chimneys into some building where they can be so treated as to render them harmless. Various methods have been tried, but no entirely satisfactory process for eliminating the poisonous elements from the fumes seems to have been yet perfected. Chemists and mechanical engineers have been at work on the problem for years, and while processes are in use which reduce the damage, none has been found that is reliable for all ores. In fact, each mine seems to create a separate problem.—S. F. Chronicle.

SQUIRRELS THRIVE ON POISON.

PLEASANTON, February 24.—That the recent crusade against the squirrels was ineffectual is the statement made by the farmers of Livermore valley, who declare that the rodents are more numerous than ever. It is feared that there will be a great loss of grain owing to the inroads of the pests, and several meetings are being planned for the purpose of discussing ways and means to rid the district of the destructive squirrels. It is claimed that much of the poison distributed by the Government had no effect on the rodents, and that not sufficient was given out by the agents of the health authorities.

FARM LANDS FOR SALE.

For Sale—By owner, good farm land, $50 per acre, in Merced County, 9 miles from Merced and ½ mile from station on S. P. and 4 miles from La Grande on Santa Fe. This land is a rich, sediment soil, situated in the Artesian Belt and an abundance of water is thus assured. Is level and all under cultivation. No alkali, and is suitable for figs, corn, alfalfa, beans, and all farm crops. Will subdivide in lots from 40 to 1000 acres. This land is very cheap at the price. In fact, it is only one-half the price of other land in same locality. For further particulars, call or address Paxton, 612 Lankershim Bldg., Los Angeles.

Perris Valley—Quarter section of 154 acres fine level alfalfa or sugar beet land; station and side track on land, near new sugar factory. All in grain with sure prospect of good crop which goes with the land. $100 per acre, part cash. Another quarter, 160 acres, near Riverside, slightly rolling; grain, orange or eucalyptus proposition; $75 per acre, very easy terms. Address owner, Chas. S. McMillan, 300 S. Marengo Ave., Alhambra, Cal.

For Sale—In Dinuba, Tulare County, California, 20 acres, 2 miles from town in splendid location on main road to Reedley. 12 acres in Thompson seedless grapes, which come into bearing next year; 8 acres unimproved. Will sell this piece cheaper than any of the surrounding property in order to make a quick sale. Price $225 per acre. Write to Sibley & McCormick or Barrett & Green, or D. H. Kash, Dinuba, Cal., about this property, which is lot 36, Producers' Colony.

For Sale—$125 per acre, 160-acre ranch in Owens River Valley, 2 miles from county seat. 12 acres Stayman Winesap apples, 50 acres alfalfa, 60 acres farming, balance pasture. Entire ranch soil suitable for apples and pears or farming and alfalfa. 100 inches water continuous flow, non-assessable. Would consider one-half exchange in Southern California. Address Owner, Box 52, Independence, Cal.

24 Acres in the Famous "Orland Project," 18 acres alfalfa, 6 acres bearing oranges; all irrigated by the U. S. Government; Orland's best soil; small residence, barn, dairyhouse, etc.; right in town, and will double in value in a short time; worth $12,000 now if cut into city lots. Will sell for $8,000 for a short time. Address owner, J. Vance Wilt, Box 71, Orland, Cal.

If You Want a Fine Home, No. 1, rich, level land, close to best market in the state, best climate, where irrigation is not required, write me. I have a few 80 and 160-acre tracts at $10 per acre. Also a fine 160-acre relinquishment for $500, if taken quickly. Wm. T. Mantz, Pattiway, Cal.

For Sale—A 20-acre farm for $20 cash and $20 a month; possession now; $90 to $125 per acre; your crops pay for the land. Rich, level land for alfalfa, oranges, almonds, grapes, cows, chickens; abundance of ditch water, for irrigation, for $1 an acre a year. Where else can you get this? In Oakdale Colony, near good town and railroad station, climate delightful. T. Wiesendanger, 207 S. Broadway, Los Angeles, Cal.

San Joaquin Valley alfalfa land for sale with railroads, schools, electric power and cheap water at hand. 40-acre tracts and up at reasonable prices. Also several large stock and alfalfa ranches with artesian water. C. H. Biggin, Pixley, Tulare Co., Cal.

Irrigated Land—The famous Gridley Colonies. Improved lands, best homeseekers' proposition in California. Write for particulars. Gridley Land Co., Gridley, Cal.

I will exchange 13-room house and lot in the railroad town of Sparks for country property. Write for particulars to Mrs. R. Cook, Sparks, Nevada.

For Sale—Near Lancaster, Cal., bargains in improved and unimproved land. Also relinquishments for sale or trade. Some homestead land. A. S. Burnham, Box 451, Lancaster, Cal.

Apple Orchards—Large and small, in the only apple producing section in California. The greatest section west of Missouri River. Write for booklet. Geo. W. Sill & Co., Watsonville, Cal.

DAIRY SUPPLIES.

Have You a Cow?—Have you a creamery? Have you a cheese factory? Write us. Everything used in either a dairy, creamery, cheese factory, or for handling milk, cream, butter, or cheese. We are in a position to quote you prices on entire creamery or cheese-making outfits. We make a specialty of only the latest and best sanitary machinery and supplies. Send us a list of what you want and we will quote prices which we feel certain will interest you. O. J. Weber Co., 225-227 East Sixth St., Los Angeles, Cal.

Milk Bottle Fillers, milk cans, cream separators, etc., at Guy F. Kelsey Co., supplies for the dairy, 108 E. 8th St., Los Angeles. Phone Sunset Main 7496.

HORTICULTURAL PRINTING.

The Kruckeberg Press, 123 South Los Angeles St., Los Angeles, Cal., makes a specialty of Horticultural Printing and Engraving. Cuts and illustrations of all standard, economic and ornamental plants on hand and subject to the use of patrons without cost. Samples and estimates cheerfully furnished. Remember, we design, write, engrave, bind and print; in brief, do the "whole thing," at no additional expense to the customer. Correspondence a pleasure.

WICK'S WHITE FOWL FARM, Moorpark, Cal

Business

GARDEN CALENDAR.

Chas. Winsel's American Garden Calendar is the best he has ever issued. It is the work of the Kruckeberg Press. It consists of 100 pages, and in addition to cataloging many of the old standbys and many of the novelties, he is handling, a calendar is given for each month of the year for vegetable and flower garden. Another feature of value appears on page 70. This is a plan for landscaping a country home. It presumes the place to be one of 15 or 20 acres, five acres of which are given over to ornamental grounds. Some of the trees recommended are purely ornamental; others are the more attractive fruit bearers. The plan carries numbers which refer to full list of plants, trees and shrubs. This particular design is for a semi-tropical effect possible in this end of the state. Among the flower seeds catalogued by Mr. Winsel is one of his newer introductions, antirrhinum majus grandiflorum, or double white snapdragon, a very striking and beautiful white flower much used in bedding and of great value as a cut flower. The booklet may be had by addressing Chas. Winsel, 211 South Main St., Los Angeles.

A WONDERFUL SEEDER.

You have undoubtedly noticed the advertising of O. E. Thompson & Son of Ypsilanti, Mich., on their wheelbarrow seeder. This seeder has been on the market for nearly forty years. Over 200,000 of them have been sold and are now in use. All are making money for their owners by increasing crops and saving seed. Almost anybody can use a Thompson Wheelbarrow Seeder. There is no trick in its operation, no experience is necessary. We would suggest to you that you write a postal card to O. E. Thompson & Sons, Ypsilanti, Mich., for complete catalog.

A NEW DICTIONARY.

The new edition of Webster's International Dictionary is the finest ever issued of that great publication. It is a book which should be in every library, and those of our subscribers who have not seen it should write the G. &. C. Merriam Co., Springfield, Massachusetts, for sample pages and particulars of this revision.

SULPHATE OF IRON.

Our subscribers often write as to where sulphate of iron may be had for spraying operations, weed killing, and sometimes for soil experiment. The largest manufacturer of this material, which is a by-product, is the American Steel & Wire Co. at Chicago. Booklets showing manner of treating seed grain for fungous diseases, killing weeds in the fields, and other valuable points, will be sent on application.

DON'T GROW OLD.

He who lives in touch with youth, enjoying boys' fun and keeping in sympathy with boys' lives is buoyant with hope and cheer and does not take life seriously enough to grow old over worries.

Would we urge frivolity then? No. But there is too much sham seriousness that ages men as does the real. Dignity is a good thing to wear in company, but a dangerous life companion. It gets a man by the collar and marches him down to old age at double quick. Dignity is a close relative to grouch. It makes men hate the laughter and cheer of youth, and in shunning youth our grouchy friend grows old.

Some men and women with white hair and eighty years behind them are young in heart and a pleasant companion for young and old. Others at forty are bowed in body and spirit, old in every sense of the word because they have gotten out of touch with youth.—Ex.

Lewiston, Idaho, is planning for the greatest stock show ever held in that state to be pulled off next fall.

General Household Notes

HASTY JUDGMENT.

"I can never consent," she was saying,
"To my daughter's becoming your bride,"
"Then sad is my fate; I am doubly
Forsaken," the young man replied.

"For the goal of my twofold desire,
I foolishly fancied I saw—
A bride with the grace of an angel,
And a young-looking mother-in-law."

Then her voice, it was sweet with emotion:
"I'm oftentimes hasty, I find,
And if here I have erred, I should do you
But justice—in changing my mind."
—Eugene C. Dolson, in Woman's Home Companion.

SAVING THE EXPRESS.

"Well, Kent, I guess we can spare you for a couple of weeks, if you would like to take a vacation," said the General Manager of the C., D. & P. Railroad.

Kent Ballard was night telegraph operator for the C., D. & P. road in the big terminal station at Chicago. He was eighteen years old, and as bright, capable and faithful an employe as the company had in their entire system. As the General Manager came and leaned over the window-shelf of the telegraph office, with his pleasant announcement, Kent looked up gladly and gratefully.

"I would like a little outing, sir," he said, "if it is perfectly convenient. It's been pretty steady work the past year; and I must confess that I am a bit tired. When can you spare me, sir?"

"Day after tomorrow, if you wish. We will have a man at our disposal then, and can put him on your work for a couple of weeks. Have you any idea what you would like to do, or where you would like to go—any vacation plan in which I could be of assistance to you?"

Kent hesitated a moment. "I have had a plan in my mind for some time, sir," he said, at length; "but I hardly dare to mention it, even now. It would be asking a great favor of the road."

"Out with it, my boy!" cried the General Manager. "If it doesn't involve us too deeply in financial embarrassment"—and he laughed good-naturedly—"I can promise you it will be granted."

"I want to make a trip over the road in a locomotive," said Kent. "I should like to go clear to the Pacific Coast, if there is time. If I could venture to ask you for permission to go on and back with the engineer of one of the overland expresses"——

"Why, of course you can, my boy!" exclaimed the General Manager. "Say no more about it. Make all your preparations, and come to my office tomorrow for your pass and written permit, in case anybody should dispute your right of way. I will speak to Mr. Faley, the engineer of the mid-week overland, and he will be ready for you on Thursday's out-bound trip."

"Thank you, sir—ever so much!" cried Kent. "It will be a great pleasure to me, and I shall never forget your kindness."

Kent Ballard told his mother, next morning, that his pet vacation project was to be realized. "I've always longed to cross the Rockies and see the Pacific," he said; "and now, if you can spare me for a couple of weeks, Mother, I am off. Fred and George will take good care of you. They have had their vacations already, you know."

On Wednesday Kent went up to the General Manager's office and got his pass and permit. "I have also reserved section twelve in the sleeper for you," said the Manager. "You will want a good, comfortable bed at night," you know. Here is your ticket. And as for your meals, get them in the buffet car regularly. The steward understands."

"Oh, sir! you are too kind!" cried Kent.

"No, I am not!" laughed the Manager. "A man can't be too kind—it's impossible. You must remember, too, that you have served us faithfully, in a difficult and responsible position, for three years. You deserve a favor now and then, according to my way of looking at things. Well, goodby to you, and a pleasant trip!"

The mid-week overland express pulled out, at ten o'clock on Thursday morning, with Kent Ballard in the cab of the big Mogul locomotive. "Our first run will be express for fifty miles," said Mr. Faley, the engineer, "and you will have a good chance to see how No. 312 behaves."

It was a trip full of profit and delight to the young telegraph operator. He was very fond of all kinds of machinery, and the mechanism of the engine proved a most fascinating study as they whirled along over the rails. Then the ever-changing scenery; the bustling cities and towns along the route; the big rivers over which they steamed on spider-web steel bridges; the wide, level prairies, across which they raced at whirlwind speed, occasionally sighting a herd of deer or frightening up a flock of prairie chickens—all these things made an endless program of interest and pleasure for Kent Ballard. Then what a thrill passed through him when at last they came in sight of the towering Rockies, with their terraced foothills, like Nature's doorstep to the threshold of the mighty range.

So far the overland express had whirled along on its long western trip without the slightest adventure. There had not even been an hour's delay. The train was sharp on time, and if everything went well its journey would be completed in twelve hours. They had now reached the ascending grade over the foothills, and were slowly crawling upward toward the pass, between the great snow-capped peaks, through which they were to gain the Pacific slope. The scenery was indescribably grand, and Kent's eyes never wearied of feasting upon it. "Oh, if Mother could only see these grand mountains!" he thought. "And if I ever get promoted to a good salary, she shall."

Nine hours passed, and at length the great engine, with an almost human sigh of relief, stopped, panting, on a side-track at the Summit Station of the "divide." A train of flat-cars, loaded with stone, and drawn by two locomotives, was slowly puffing up the western grade. The express had to wait on the siding until this freight train should pass and leave the main track clear. While they were waiting, Kent Ballard left the engine and took his seat on the rear platform of the

last car, where he could look back at the grand snow-capped mountains they had just passed.

The heavy freight train struggled up the grade until it had passed the lower end of the siding, and then stopped at the water tank on the main track. A few minutes later the express pulled out, and the switchman again set the main track open. Kent remained on the rear platform of the train, looking back at the mountains. Presently he saw the freight train endeavor to start up again. The engines backed a trifle, and then, as the car brakes were released, went forward with a jerk.

Kent Ballard suddenly jumped to his feet. What could it mean?—the freight train seemed to be backing down the heavy grade after the express, instead of going straight ahead. But no! the engines and the main part of the train were going the other way. Then the startling truth flashed upon the young man. The jerking start of the heavy engines had broken the train in two, and the rear part of it, without a brakeman aboard, was running wild down the steep grade after the express!

What was to be done? Fortunately, Kent Ballard was not one to be easily confused in an emergency. He was noted for always "having his wits about him." Plainly, the first thing to do was to warn the engineer of the express. But this must be done without alarming the passengers and throwing them into a panic. Some persons would have been just foolish enough, on making the discovery which Kent had, to run back through the train, crying: "Get ready to jump for your lives! There's a runaway freight train on the track behind us!" But Kent did not even hurry through the cars on his way forward to the engine, lest he should thereby excite the suspicions of the passengers. Even the brakeman did not suspect any danger from his actions as he passed through the train. But as soon as he reached the baggage car, where the conductor was sitting, he motioned the latter to follow him. Rushing to the forward platform, he climbed on top of the tender and shouted:

"Faley!"

The engineer did not hear him at first.

"Faley!"

The man turned quickly.

Crowd on steam! That freight train has broken in two and is chasing us down the grade!"

"Good God!" exclaimed the conductor, who had followed Kent out on the platform of the baggage car. "Let her out, Faley! I will go back and signal you from the rear car."

The conductor disappeared, and Kent crawled over the tender into the engine cab. Faley had already "let her out" as much as he dared on so steep a grade. Presently, however, came the clear signal of the conductor's bell—"More steam!" Faley's hand was on the throttle; but he hesitated. "It's worse to jump the rails than to get overhauled on the track," he muttered. "But here goes! I'm in this cab to obey orders."

He threw the throttle wider open, and the great engine rocked and plunged at more terrific speed down the sharp incline. "Those stone cars must be terribly heavy," exclaimed Kent.

"Yes. How many of them broke loose—do you know?" asked Faley.

"Not exactly," replied Kent; "but I should say four or five."

"Enough to smash the whole express to bits!" muttered the engineer. "It's curious how much faster a loaded freight car can travel on a down grade than a locomotive, even. Seems to get a greater momentum. Good heavens! He wants more steam!"

The conductor's bell clamored its signal twice. Faley threw the throttle wide open. "There!" he exclaimed. "If that doesn't save us, it will smash us!"

Kent Ballard had been thinking very hard for a few minutes. A project was forming itself in his mind. Suddenly he grasped the engineer by the sleeve and asked eagerly:

"How far ahead is the next station?"

"About five miles."

"Siding there?"

"Yes."

"Telegraph operator?"

"Yes."

"Good! I have a plan. Let me work the whistle. I'll signal them! What is the name of the station?"

"Mineville."

Kent Ballard grasped the whistle cord. In sounds corresponding to those of the Morse code when ticked out by the instrument, he signalled:

"Mineville! Attention."

After a few seconds' pause he repeated the call. "How far are we from the station now?" he asked.

"Between three and four miles," answered the engineer. "You can calculate a little more than a mile to the minute."

Kent repeated the call once more, and allowed a pause of ten seconds. Then he telegraphed, by sounds:

"Open the siding, quick!"

Then a pause of ten seconds, and again:

"Open the siding!"

The station was now in sight. Men were running to and fro in front of it.

"I've telegraphed them to open the siding!" shouted Kent in Faley's ear, for the train was roaring and thundering on at terrific speed.

"And sure enough, they've done it!" exclaimed Faley, shutting off steam and setting the air brakes. "The signal says 'siding open.' You've either killed us or cured us—depends on how close behind the freight cars are."

It was a minute of terrible suspense. The express, its speed slackened just in time by the powerful air brakes, glided on to the siding. Would there be time to throw open the main track again, before the runaway freight cars came on?

"Jump!—we've done everything we can, "cried Faley to Kent and the fireman, as the express stopped on the siding. Even as they jumped, there was a roar like a thunder peal on the right side of the engine, and a dark shadow passed with the swiftness of lightning.

It was the runaway freight cars, thundering by on the main track! The stationmaster had thrown open the switch rod and closed the siding, just in time.

It was not long after this experience that Kent Ballard got his promotion; and the next time he visited the Rockies it was as assistant general passenger agent of the C., D. & P. railroad. On this trip he brought his mother with him in a Pullman car.

A strong solution of potash should be frequently used in rinsing out a kitchen sink; it not only removes all traces of grease, which so often resist the gentler influence of mere soap, but decaying particles from the drain pipes, and is to be regarded as an important sanitary measures.

OWENS VALLEY.

By Thos. C. Evans.

Your correspondent has just returned from a trip through Owens Valley and has decided to enumerate the things he saw and heard. One sees more than he hears, however, since Owen Valley farming folk are small talkers.

The Owens Valley train departs from Los Angeles at half after seven each morning. Dinner in the celebrated Harvey house at Mojave; thence on across the great desert until the snow-capped Sierras appear above the foothills. And permit me to say, in passing, that the sight of old Mt. Whitney rising to the sublime height of 16,000 feet is an inspiring one. Lone Pine is reached late in the evening and the passenger pushes on to the comfortable Mt. Whitney Inn where a good night's rest and excellent board bolsters up the tired tourists. From Lone Pine a fairly good mountain road takes you to the valley proper. One sees nothing of farming until the Lacey ranch is reached. There for many years the soil has yielded up a great store for the family whose name the ranch bears.

The Shepherd ranch comes next, where George Chaffey, the well-known land and water promoter is putting this ranch on the market in ten and twenty-acre ranches. Great evidences of business are manifest at the Shepherd, or George's Creek ranch. Seven hundred acres are being leveled, plowed and arranged for fruit trees; two artesian well outfits are on the ground ready to bore for the big vein of water, which is assured in immense quantity by the engineers. Forty or fifty men are digging trenches for irrigation pipe, which by the way, is the finest iron riveted pipe to withstand a severe pressure. Road scrapers were at work making good roads crossing the ranch from end to end. In all it was a constant bustle and excitement. Mr. Nordyke the ranch manager, who oversees manual labor, is a very busy man. Mr. Nordyke comes from Whittier and is a practical farm manager. George Hanson took me in his automobile over the tract and more than thirty twenty-acre lots were being put into cultivation. The sage brush which abounds on all this land was being brushed aside with heavy railroad irons, six horses doing the work. In many places the plow was following the clearers.

The Chaffey people are planting a large acreage of apples, part for themselves and part for people who do not live in the valley. It is learned that the nursery stock comes from the finest nurseries of Oregon and Washington. The principal varieties planted are Winesap 65 per cent, Spitzenbergs 30 per cent, mixed varieties the remaining 5 per cent.

The samples seen on the Shepherd ranch indicate that the two former varieties are good producers in the Owens Valley, although Smith's cider, Jonathan, Delicious, King David, Ben Davis, Imperial, White Winter Pearmain and Newtown Pippin do well.

The water supply at the Shepherd ranch will be brought down in a stone and cement conduit to the line of the property and from thence diverted to the various lots by riveted iron pipe. The pressure will be tremendous owing to the fall. In order to prevent a loss of 65 per cent by seepage in streams Mr. Chaffey took the precaution to save the water by bringing it down in a stone conduit.

The mules and workhorses on this ranch were fine big specimens. It was pointed out that they had never eaten grain in their lives although the work done is of the heaviest drafting. Alfalfa grows abundantly in the valley and contains that nutriment that ordinary grain holds.

From the Shepherd ranch we drove to the Dean orchard where about twenty acres of the most ordinary trees ever seen grew crops averaging 15 boxes to a tree, although the owner has never during the life of the trees, sprayed, pruned or properly cultivated his trees. This is strong evidence that good care will bring Owens Valley apples to the notice of the world.

Independence, a neat little town of 500 inhabitants, was the next stop. The situation is beautiful and the town is surrounded by fine farms that bring profit and pleasure.

Your correspondent had the pleasure of talking with Mr. Baxter, who has farmed his place for forty-two years. He has a fine alfalfa field, fruit trees of all kinds and about 300 stands of bees. The bees are bringing in about $1500 each year, and the Baxter honey is eaten in the homes of New York millionaires each year. The apples last year averaged nine boxes to the tree; alfalfa eight tons per acre for three cuttings a year.

On the Summers ranch, above Bishop, on 400 acres of alfalfa, 3200 tons was cut last year which received only two irrigations during the year. This is the record crop under the circumstances in the Owens Valley and should stand against all comers for some time.

Many other nice farms, big and little, were noticed between Independence, the county seat, and Big Pine. Notable among others is the chicken ranch of Hon. Fred Eaton near Big Pine. He has 6000 laying hens, 250 to a pen. The breed is of the best strain of White Leghorns. Just at present Mr. Eaton has 30,000 eggs in his incubators. The houses are all scrupulously clean. The estimated cost of the buildings is $100,000. The markets for this wonderful ranch are all in Nevada. The average price for eggs and chickens is far above any other in the West.

Big Pine nestles against the foothills comfortably and is a neat little town of 800. The view of the high Sierras is just like that from the other towns in Owens Valley.

The ranch of "Bull Frog" Smith was particularly noticeable owing to the fact that his apple trees, Winesap and Smith's Cider varieties, were as clean as mahogany and were properly pruned. Mr. Smith took 15 boxes off each tree last year. His ranch is well cared for, although he was formerly a mining man.

Many nice homes abound all through the valley and good farms and stock meadows line the turnpikes. Stock cattle looked sleek and fat and horses and mules do exceedingly well. Sheep in countless droves browsed along the grazing fields and were in pink of condition. Young lambs were frisking around as in spring although the temperature registered 29 degrees.

Timothy and oat hay is very plentiful through the Owens Valley. Most all of the farmers raise good crops of both these feeds. Wheat is also a good crop.

Bishop, the largest town of the valley, is a prosperous place of 1500 and fast growing. Around Bishop are many fine ranches and on each can be seen good houses and well-kept stock. Water is just as plentiful there

(Continued on page 319.)

Shrinkage vs. Stability

MANY persons have found that their investments in stocks, bonds, real estate, etc., have shown large shrinkages in value during the past year. But there has been no shrinkage whatever in the value of a Savings Bank Deposit—either in principal or Interest.

Money deposited here earns at a fixed rate that you can thoroughly depend upon. And the income is clear, because money in Savings Banks is tax-exempt.

Consider these FACTS carefully. Remember, they apply equally to large sums or small—and that the Depositor of Ten Dollars receives the same consideration, courtesy and rate of interest as the Depositor of Ten Thousand.

Accounts opened at Four and Three Per Cent Interest—the latter with checking privileges under moderate restrictions.

¶ Perfect Safe Deposit Facilities. Boxes and Storage at Moderate Rates.

Honey.

Water white comb, '10	13@15
Dark comb	12½
Extracted white	8
Extracted dark	6½
Beeswax, lb	24@30

Hay.

Scott, Magner & Miller say: Arrivals of hay for the week ending today amount to 2,545 tons, a large decrease from last week, when the receipts were 4,167 tons.

Although receipts are much less and within reason, yet the market has shown no improvement. Wet weather has had its usual depressing effect on the market, which remains dull and weak. Export demand has been very light.

We quote the wholesale prices in round lots on today's market, as follows:

Fancy wheat	13.00@13.50
No. 1 wheat or wh and oat	10.00@11.00
No. 2 wheat or wh and oat	9.00@10.00
Choice tame oat	10.00@11.00
Other tame oat	7.50@9.50
Wild oat	7.00@9.00
Stock hay	5.00@6.50
Alfalfa, ton	9.00@10.50
Straw	40@50

Grain.

Wheat, No. 1	1.30@1.40
Barley, fancy	1.13¾@1.14
Barley, good to choice	1.10@1.12½
Barley, poor to fair	1.07½@1.10
Oats, white	1.50
Rye, new crop	1.50@1.60
Alfalfa seed	18@20
Mustard, brown	4½
Millet	2¾
Flaxseed	5@5½
Broom corn seed, ton	23.50

Feed Stuff.

Cocoanut cake, ton	25.00@26.00
Mixed feed, ton	25.00@26.00
Shorts	25.00@26.00

THE COMING ALMOND CROP.

Sales Manager Tucker of the California Almond Growers Exchange, is sending out crop report No. 1 as follows:

Sacramento, Cal., March 4, 1911.

The weather so far has been very unsatisfactory for the production of almonds, it being quite cold and raining more or less during the past ten days or two weeks. It has hit the Ne Plus and IXL quite hard, as they are in full bloom at this time, and the Nonpareils are partly in bloom. This is just the time we need plenty

of sunshine for these varieties, and as a result we will have an unusually short crop of Ne Plus and IXL, possibly a fair crop of Nonpareils. The Drakes are not in bloom at this time and it is impossible to make any prediction as to the size of crop of this variety, but the cold weather is holding them back considerably.

We believe that the weather conditions here at this time will strengthen the almond market considerably throughout the East, and we would not be surprised to see an advance in the market on the balance of the 1910 crop now on hand. This balance is very small indeed.

We have moved out of the warehouses several cars since the first of the month, and we have approximately 14 cars left to be sold.

Citrus Fruit Market

LOS ANGELES, March 8, 1911.

The orange market has improved, if anything, during the last week. Extra fancy navels are now commanding an average of about $2.50, with off sizes and the lower grades running 15 to 25 cents under those figures. The daily shipments are now approaching the 200 mark, though the storm of last week prevented cutting, so that at present the shipments are slightly under normal. The excellent quality is causing most favorable reception in all quarters. Puffing which started early in the season is not so noticeable since the cooler weather began.

The lemon market is featureless, every shipment being taken at fair prices.

Shipments.

Shipments of oranges to date since November 1, 1910, 12,303 cars; of lemons, 1,608; making a total of 13,911. To same date last season: Oranges, 7,923; lemons, 1,336; total, 9,259.

NEW YORK, Monday, March 6.—Forty-three cars navels, two cars bloods and three cars lemons sold. Market easier on navels, steady on lemons. Snowstorm raged during sale; fair this afternoon.

ORANGES—Californias are selling very well. They are ruling steady to firm. Receipts are just about ample, and there is no accumulation. Boxes, California navels, extra fancy, all sizes, $2.60 asked; fancy, $2.50 asked; extra choice, $2.35; choice ,$2.15.

The Santa Ana Valley Walnut Growers Association is suing a member for fines imposed because of selling nuts outside of the association.

Orange county shipped $78,000 worth of celery during January.

OWENS VALLEY.

(Continued from Page 317.)

as in the lower end of the Owens Valley and is very cheap.

The potatoes grown in Owens Valley are of the variety grown in Greeley, Colorado. The crops never fail and big prices are obtained. As many as 500 bushels are raised per acre. Turkeys thrive as there is no dampness. Peaches, apricots, cherries, plums, apples, all do well. Tomatoes are big revenue producers, as many as 800 crates per acre being raised. Almond trees, the first spring bloomers, grow large crops each year and as yet frost has not killed them.

Frost comes in November and leaves in the middle of March. Many apple growers realizing that big red apples must have cold weather, are preparing to protect orchards by the latest models of smudge pots. A fruit association has been formed and all of the fruit will be sold by a central office. It is said that the acreage set out in the next year will be upwards of 2000 acres.

Railroad facilities are good but are being improved. Rates are being reduced and the valley is in full touch with the rest of the world.

This great inland valley raises corn as good as that of Nebraska and this is fed to hogs after they have been fed on alfalfa six weeks..

Water is abundant; lands are rich, composed of silt and broken granite, and can grow abundant crops of everything but citrus fruits. These conditions being such Owens Valley is bound to take its place with the richest valleys of the world.

A WINDOW-WASHING HINT.

Do not put soap into the water with which windows are to be washed. A little borax or household ammonia may be added. Use very little water. Wipe off the window casing with a dry cloth and rub it over the glass as well before you begin to wash. This removes the dust which would otherwise streak the pane. The cloth should be well wrung out before it is applied to the glass and this should be rubbed dry at once. A small quantity of kerosene added to the water gives a polish to the glass and in winter a little alcohol in the water keeps it from freezing on the pane. Old newspapers rubbed soft in the hands are admirable for giving the glass a final polish.—Woman's Home Companion.

LACK OF RAIN DOESN'T WORRY THESE FARMERS

Last year several hundred farmers decided that they had worried just about long enough over lack of water. So they bought I H C Gasoline Engines and installed irrigation systems of their own.

Now they have the most practical kind of crop insurance and they are independent of the irrigating companies.

Nearly every farm has a creek, slough, pond, or some other source of water supply that can be turned into a valuable asset by the installation of an

I H C Gasoline Engine

Why not put yourself in a position to have water where and when you want it—irrigate your entire farm if need be?

I H C Engines are admittedly the best power for this purpose. They require but little attention and their superior efficiency and economy have been proven by years of service. In addition to running your irrigating system they will do a host of other things such as running a cider press, alfalfa cutter, feed grinder, saw, washing machine, cream separator, etc., better and cheaper than any other power. There are all styles and sizes to choose from, 1 to 45-H. P., horizontal or vertical—stationary, portable, or traction.

Call on the I H C local dealer and let him show you the one best adapted to your needs; if you prefer, write direct for the I H C Engine catalogue.

I H C Service Bureau

What is it? A clearing house of agricultural data.
What does it do? Helps farmers to help themselves.
How can it be used? By sending your farm problems and puzzling questions to the Bureau.

We are co-operating with the highest agricultural authorities and every source of information will be made available to help solve your difficulties. We shall be pleased to have an opportunity to assist you. Write the I H C Service Bureau

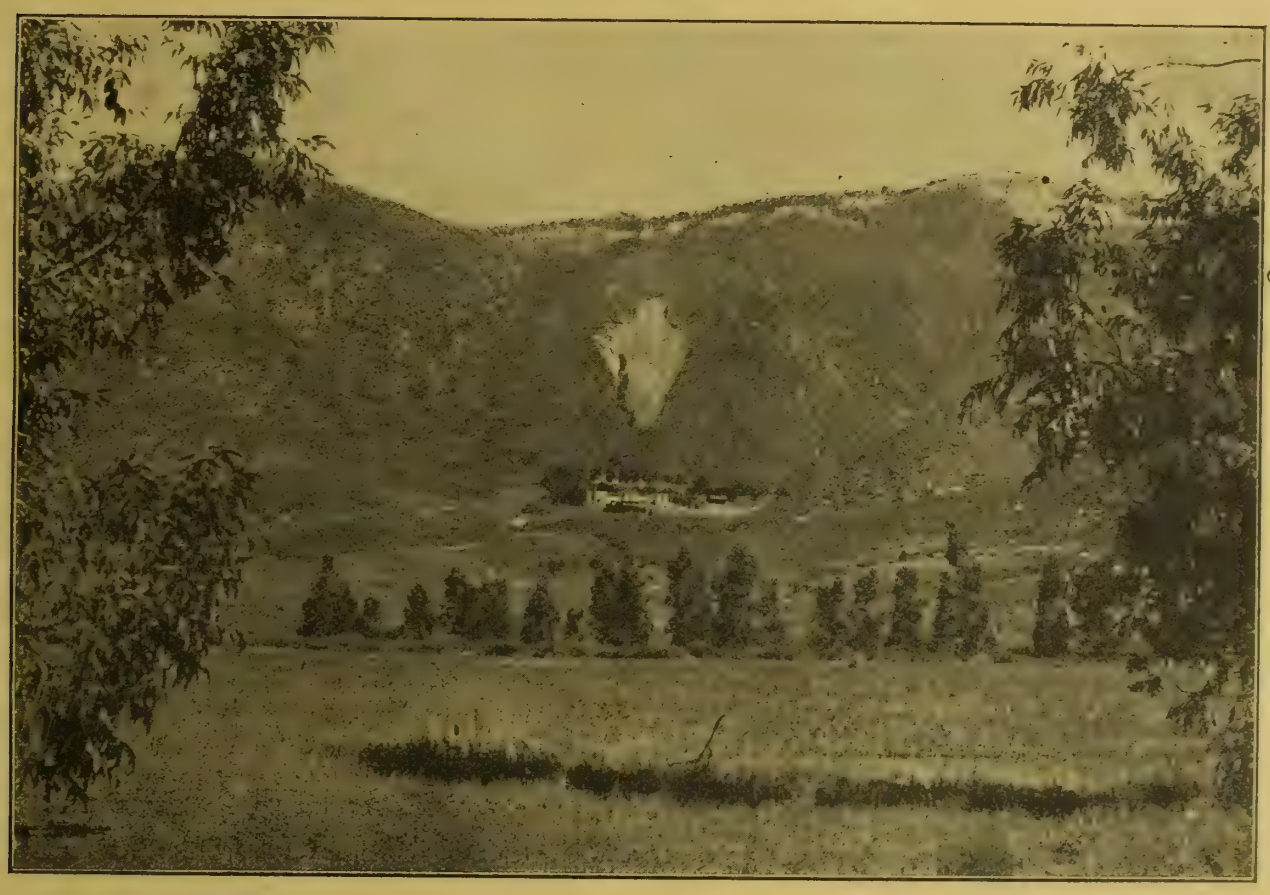
California Cultivator

An Illustrated Weekly devoted to Horticulture and Agriculture

LOS ANGELES MARCH 16, 1911 SAN FRANCISCO



THE ARROWHEAD OF THE SAN BERNARDINO VALLEY.

On the twentieth day of May, one hundred years ago, the Guachamas, the peace-loving, indolent inhabitants of the "Valley of Plenty," on the day of San Bernardino de Sienna, welcomed the ambassador of the Mission San Gabriel, the first white man to erect a building in the shadow of the Arrowhead, the mighty symbol pointing from the grim mountain side into the smiling paradise. A strategic position did the good padre choose for his chapel. On the slope of a hill he built, close to the place where never-failing springs sent their water through moist meadows, "cienegas," into the flashing creek. To the north the site commanded an unrestricted view of El Cajon, the entrance to the pass leading through the mountain wall into the country of the martial desert and mountain Indians, the white dome of Mount San Antonio standing guard over the cleft. To the east, where a meandering strip of brilliant white sand, marking the course of the trout-filled river, slashed the green plain, the site faced the twin peaks of Mounts San Bernardino and San Gorgonio in their wintry, sleepy snow cap. To the south the chapel looked across the valley to the naked brown hills swelling into the crest of the Coast Range, over the shoulder of which peeked Mount San Jacinto, a white cloud on the way to the turbulent Rio Colorado. Only to the west, whence the disciple of St. Francis had come, no barrier intervened between the peaceful vale and the tempered trade winds of the Peaceful Sea.

For two years the maid of the mountain tribe watched the doings of the valley Indians from her rocky perch. About the chapel she saw her kin learn the use of the cumbrous plow, saw the blade tear into the virgin soil, saw the sowers rejoice at the bountiful crops yielded forth by the "Valley of Plenty."

For two years the bell tolled at sunrise and sunset, calling the dusky believers to prayer and to work in the new fields under the guidance of Hipolito, the devout red pupil of the padres left in charge of the outpost. Two years the idyl in the vale of abundance lasted, then the temblors came, shook the earth and aroused the superstitious fear of the Guachamas, who fell upon the mission's branch, massacred the brown missionaries and razed the chapel, as an offering to the enraged gods. But they did not destroy the fields. They had learned that the soil was a storehouse of meals to be had for little work, an unfailing source of grain and fruit, and though they drove out the strangers, the Indians remembered the strangers' art and practiced it.—Walter V. Woehlke, in San Bernardino Times-Index.

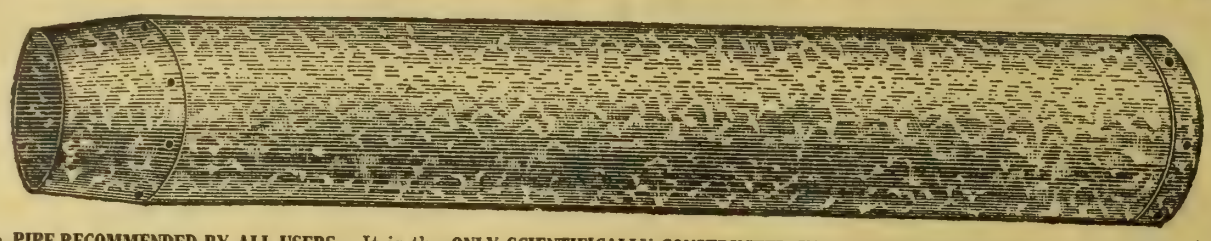
* * *

Later the Gringo came and brought still greater intelligence to the culture of the soil and the orange, the lemon and the olive fruited more and more, until the great arrowhead points to one of the garden spots of the world.

Proof of it was made last week at the National Orange Show. It was a magnificent showing of citrus fruits of all kinds, also of packing and other appliances of commercial and cultural orange orcharding.

Some facts regarding the show and awards may be found on another page.

SAVE YOUR TIME WATER and GRADING BY IRRIGATING WITH AMERICAN SURFACE IRRIGATION PIPE



The **PIPE RECOMMENDED BY ALL USERS.** It is the **ONLY SCIENTIFICALLY CONSTRUCTED SURFACE IRRIGATION PIPE** on the market. **THERE'S NO ROUND SEAMS TO LEAK,** retard the flow of water or weaken the pipe. This pipe is easily handled and cheaper than flumes. It will last a life-time. For irrigating alfalfa it is the only pipe to use. We make **RIVETED PIPE AND TANKS.** Write for Illustrated Catalogue, also **SPECIAL IRRIGATION FOLDER** which may mean much to you.

American Steel Pipe & Tank Co., General Offices 342-43 Pacific Electric Bldg., **Los Angeles, Calif.**

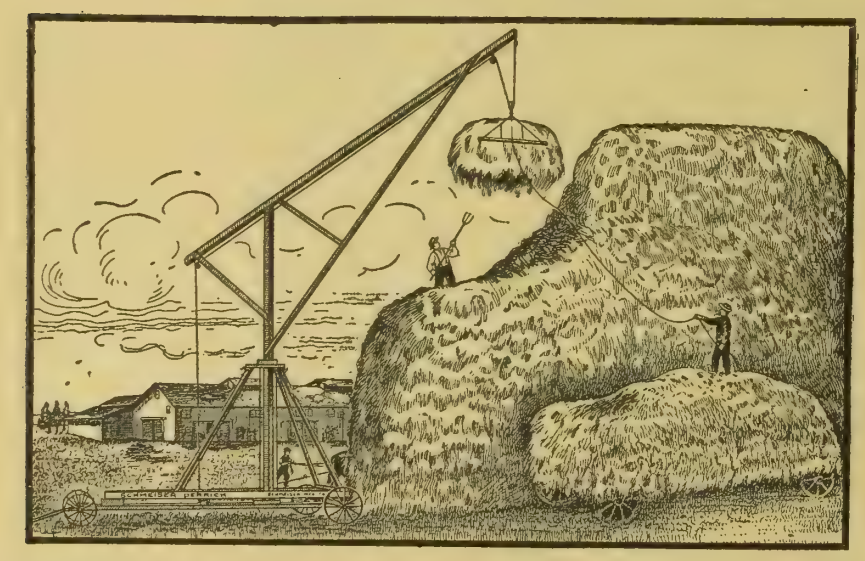
Portable Automatic Derrick

WHAT IS IT?



The greatest time and money saver on a farm. It is so handy you can use it for anything you want to hoist.

Last season Mr. H. C. Porter of Alpaugh, Calif., saw our ad in the California Cultivator and, after securing descriptive circulars and prices, he ordered one of our Medium Derricks. The following letter indicates that he is well pleased with the Derrick:

ALPAUGH, CALIF., Feb. 18th, 1911.

SCHMEISER MANUFACTURING CO., Davis, Calif.

GENTLEMEN:—Please send circulars describing your Portable Automatic Derrick to the following:

H. H. Cathcart, Jacob Sonke, J. A. Callister, A. D. Overman, A. B. Ward, F. N. Beason, Ernest Shields

—All of Alpaugh.

Some of them have used my Derrick and all have seen it work and think it is alright. They have alfalfa and need one. I am more than pleased with my Derrick and, with labor scarce and high priced, it is a great saving.. If you wish, I will act as your agent here and try to sell some Derricks.

Yours respectfully,

H. C. PORTER.

We want your name and address if you are a grower of alfalfa or any other kind of hay, so that we may send you circulars describing our Portable Automatic Derrick, a money-maker for you.

☞For further information drop a postal to the

SCHMEISER MANUFACTURING CO.,

DAVIS, CALIF.

ARNOTT HARNESS $10.00 to $80.00

Everything guaranteed. Money back if not satisfactory. Factory in Los Angeles. California leather for all uses. Send for No. 10, eighty page FREE Catalogue.

ARNOTT & COMPANY 112-118 So. Los Angeles St. Los Angeles, Calif.

The Luitwieler Non-Pulsating Pumping System

Deep Well Pump Talk Continued:

Cut shown is of the Machine Room of the Luitwieler Factory, 60x267 feet. The Plant is fully equipped with the most modern machine tools, and turns out perfect machines ready for use—no pit is required, and babbiting on other machine work has to be done in the field. Luitwieler Pumps come finished ready for starting. Order now. There's a reason for our success. Most economical and most durable. Established 1877.

Luitwieler Pumping Engine Co. Los Angeles

Heider Eveners

A Great Invention. Made for 2, 3, 4, 5 or 6 horses. The **HEIDER** 4-horse Plow Evener works four horses abreast on gang, sulky or disc plow, one horse in furrow, three on land. Works free, no side draft, all horses pull equal. We make clevises to attach our Eveners to all plows. **HEIDER** 3-horse Wagon Evener for wagon, manure spreader, grain drill or any other implement with pole. **GO TO YOUR DEALER**—if he can't supply you—don't accept any other. Write us for catalog and we will tell you where to get them. We also make Wagon Doubletrees, Singletrees, Neck Yokes, etc. Insist on getting **HEIDER'S** if you want the best in **EVENERS.**

Ask Your Dealer.

Vol. XXXVI. No. II. LOS ANGELES: THURSDAY, MARCH 16, 1911 One Dollar the Year

Citrus Growers Convention at San Bernardino

Thirty-Ninth State Fruit Growers Convention in Session Discusses Matters Pertaining to Citrus Culture. Many Valuable Addresses Made.

The point most definitely brought out at the convention of citrus growers at San Bernardino last week was that there is still much to be learned in both the art and science of orcharding. If there was ever a convention where "We don't know" cropped out so emphatically as in this, it is yet to be reported. Repeatedly practical growers were overheard remarking "Why can we not have experiment station service and government expert service which will investigate these soil and other problems and tell us?" Take for instance the question of chlorosis. After discussing it from all sides the only thing of a decided nature stated regarding it was that the exact cause and remedy are impossible to state.

Work now being taken up in the matter of developing a higher quality of citrus fruit, especially of the Washington Navel, by the Bureau of Plant Industry through Mr. A. D. Shamel is one of the hopeful things before the citrus grower. Mr. Shamel was present at the convention, and while, as he said, it is yet too early in his work to give any conclusions, he gave the outline of work he is following, and his address will be published in next week's Cultivator. It is one of the valuable additions to citrus literature and shows promise of great results.

The work of standardizing in the North was referred to by State Commissioner Jeffrey, and the point enforced that while the citrus grower is by no means in such a condition as was the deciduous grower of the Sacramento valley, before standardizing, yet there is abundant opportunity for advancement in this industry. A resolution was passed empowering the state commissioner to appoint a committee of fifteen to take up the matter of standardizing citrus fruits. Up to the time of adjournment the commissioner had not appointed this committee.

Other resolutions all recommended by committee composed of Messrs. Pease, Paine, Yoakam, Koethen and Essig, passed, included the usual ones of thanks to the people of San Bernardino, especially the management of the National Orange Show, and the newspapers for liberal reports, the state university and the Southern Pacific Company for their demonstration train service, and the custom house officials of this coast for aid extended to the horticultural quarantine deputies. Mr. Maskew's report brought out the fact that he received much aid from these officials and that the work would be far from effective did he not have their co-operation. Another resolution fully endorsed Commissioner Jeffrey's administration and urged his reappointment. Another extended thanks to the Bureau of Plant Industry for its work especially in sending Mr. Shamel to Southern California for scientific investigations.

Considering the weather which, to be English, was beastly, the attendance was exceptional, though not equal to that at the Pomona meeting last summer. At most of the sessions, however, there were a hundred or more in attendance.

Many of the addresses made will be given in a later Cultivator and one appears in the citrus department on the following page, but it is impossible to give even an outline of the program. Many good things were given which were not announced, and on the other hand some features of the program were omitted. One feature brought out in the discussion on fertilizers was the following letters to Carroll B. Smith. The first is from Dr. F. H. King of Madison, Wis., in r ply to a query by Mr. Smith, and the other, comment by Dr. E. W. Hilgard.

* * *

Dr. King's Letter.

I am in receipt of your letter of Feb. 21st in which you say:

"Your contention made at Los Angeles, regarding the formation of black alkali from nitrate of soda has created a rather continuous discussion through our local agricultural papers and I am enclosing the answer which is given by Mr. Myers of the Nitrate Propaganda of New York, and I should like to know your reply to Mr. Myers. Therefore, in looking over the inclosed article from the Pacific Rural Press, I wish you would, in addition to your own reply, say what you think of the use of acid phosphates to neutralize the effect of any black alkali that may be formed.

"It seems to me that our soils are entirely alkaline enough to neutralize the acid phosphate and still leave the black alkali in as an excess. Do you think that arid soils have a tendency to grow acid and therefore are benefited by the formation of sodium carbonate? Do the potashes actually leave an acid residue "

Hilgard's abundant analyses of California soils show them to contain, generally, so much lime carbonate that little or no advantage can be expected from the use of sodium nitrate in correcting acidity.

When potash fertilizers are utilized by crops as a source of potash, the acid radicle, if not appropriated by the crop, must be released, and acts as an acid factor until neutralized by some other base. Mr. Myers, (in The California Cultivator of Jan. 19th and) in the Pacific Rural Press of Feb. 18th, says:

"Some time since a convention of horticulturists in Los Angeles discussed the question of accumulation of black alkali in soil.

"One speaker made the statement that the use of nitrate of soda would result in such accumulation, stating that in England this has been the case, and that English farmers were avoiding the use of nitrate.

"The incorrectness of this latter statement is shown by the fact that the use of nitrate of soda increased last year by 10 per cent in England and its use is constantly growing there."

Two direct questions from A. D. Hall, director of the Rothamsted Experiment Station, England, is the most authoritative reply that can be given to this. In recommending the use of calcium nitrate instead of sodium nitrate, Hall says:

"Indeed on some soils it is likely to be more valuable because, as will be shown later, part at least of the lime base will be left behind in the soil as calcium carbonate. This will be an advantage in peaty soils and will save clay soils from the peculiar wetness and stickiness which results from the employment of much nitrate of soda."

Again, on page 54 of his Fertilizers and Manures, he says:

"One of the most characteristic effects of nitrate of soda as a manure, either repeatedly or in any quantity, is its deleterious action upon the texture of heavy soil; farmers have repeatedly observed that where nitrate of soda has been applied the land remains very wet and poaches badly if it is at all disturbed before it has dried. Market gardeners in particular have found this destruction of the tilth a serious drawback to its use. Some of the Rothamsted plots in the mangold fields, where very large amounts of nitrate of soda have been applied year after year for the last 50 years, show this deterioration of tilth in very marked fashion, the land being intolerably sticky after rain and drying into hard intratable clods, so much so that it is very difficult to secure a plant of roots unless the season is favorable."

I need hardly say that many of the orchards we visited in your state were of even more intensely clay types than the case cited by Hall, and that it is only with the greatest difficulty that water can be made to penetrate to sufficient depths. It is essential for your people to observe that with all the leaching of English soils, from their large rainfall, nitrate of soda applied alone is very injurious to clay soils. In California soils this leaching is quite impracticable.

It is quite true that we are learning to use sodium nitrate with less harmful results in humid climates, and to advantage, where it is the cheapest source of nitrogen, but it should not be overlooked that it is the rainfall and leaching that makes this possible.

It is very important to remember:

(1) That substances dissolved in soil moisture beyond critical amounts render soils sterile even though the substances be the most essential plant foods. They do this primarily because of the strong power they have over the water, making it difficult for the plant to use, and some of them may be corrosive or toxic.

(2) That the conversion of black alkali into white alkali only substitutes a less harmful for a more harmful agent and the smaller the amount of moisture in the soil the more harmful the non-corrosive white alkalies become.

(3. White and black alkalies are continually forming from the natural decay of all soils and tillage hastens the action.

(4) The irrigation water applied every year makes another material addition to the alkali salts which does not occur in unirrigated soils.

(5) With only the very meager vegetation (native) your rainfall has not been sufficient to prevent the accumulation of alkalies in injurious amounts.

(6) With your larger crops, to increase the loss of soil moisture by evaporation, it is doubtful if you will be able to secure as much leaching on many soils as occurred in the virgin state while in other cases injudicious irrigation transfers the alkalies in dangerous amounts to adjacent areas.

Whoever reads Mr. Hall's discussion of the use of sodium nitrate as a fertilizer should keep in mind that he is speaking of conditions under which abundant leaching occurs, and hence Mr. Myer's statement: "Moreover, the use of acid phosphates associated as they are frequently with sulphate of lime, converts any alkali residue into harmless forms of soda."—is not applicable to California conditions except where there can be sufficient leaching, and leaching is extremely difficult to secure by irrigation even where there is plenty of water. His phrase, "Harmless forms of soda," is misleading when applied to arid soils. It must be remembered also that Hilgard has shown that while sulphate of lime may convert black into white alkali, under the wet, puddled condition of soils, this action may sometimes be reversed, changing the sodium sulphate into the black alkali.

Then, regarding the statement: "Besides, in the vast majority of soils in the United States, probably 95 per cent have a tendency to grow acid rather than to grow alkaline, and nitrate of soda is therefore highly beneficial in the majority of such cases," it must be remembered that while there is some truth in the statement for soils largely devoid of lime carbonate, it has little application to California soils, which Hilgard has shown to be exceptionally rich in lime. The same must also be said regarding the contention that sodium nitrate is needed to neutralize tendencies to soil acid-

Citrus and Tropical Fruits

BLEMISHES OF CITRUS FRUITS.

By Dr. J. Eliot Coit, Assistant Professor of Pomology, University of California—Address Before the San Bernardino Citrus Convention.

A large increase in the production of citrus fruits will mean, if it means anything, a keener competition in the markets. In order to meet this increased competition, California growers and packers are being encouraged to adopt higher ideals in grading and packing. With more rigid grading, the cull heaps at many of our packing houses assume large proportions. A conservative estimate places the direct loss this year from cull oranges alone in excess of half a million dollars. This amount is considerably augmented by losses from brown spot and decay after the fruit has left the packing houses.

It seemed worth while, therefore, to begin a systematic study of the cull heap, with the idea, first, of classifying and determining the relative importance of the various blemishes which cause oranges to be thrown into a lower grade or into the cull bin; and, secondly, of determining how far it is practicable and by what means the proportion of culls to packed fruit may be reduced.

Such a study, in order to produce results of wide application, should be carried on in many different localities during several years, and all the data averaged together, for it is well known that there is considerable variation in the amount and quality of culls in different years and in different localities.

This work is now in progress, and counts have been made in twelve different packing houses, each located in a different locality in Southern California. So far, Navel oranges only have been studied, but it is intended to increase the scope as the work progresses. A final report is to be made later.

At this time I will discuss briefly the nature of the different blemishes which I have studied.

Blemishes of Citrus Fruits.

The blemishes of citrus fruits may be classified according to their cause. I have therefore grouped them under four heads, namely: Insect, fungous, mechanical and physiological blemishes:

Caused by Insects — Thrips, tortrix, red scale, yellow scale, purple scale, brown scale, black scale, mealy bug, red spider, silver mite, grasshopper, and some others.

Caused by Fungi—Brown rot, Pythiacystis citrophthora; blue mould, Penicillium italicum; green mould, Penicillium digitatum; gray mould, Botrytis cinerea; sooty mould, Meliola camelliae; cottony mould, Sclerotinia sp.; gray scurf, fungus not identified; wither-tip, Colletotrichum gloeosporioides; navel end rot, Alternaria citri; stem end rot, Cladosporium sp. (secondary).

Mechanical Injuries — Bruises, thorn stabs, cultivator scars, clipper cuts, stem punctures, fumigation scars, shoulder spots, hail scars, windfalls, cement dust, and others.

Physiological — Sunburn, frost, offbloom, too small, exanthema, corrugations, bottle neck, fingers, yellow spots, double navel, brown spot, stem end spot, cracks, puffs, splits, pitaca, red blotch, and others.

As a result of counts of Navel culls made in twelve houses during January and February, 1910 and 1911, it appears that on the average the most prolific causes of culls are as follows, according to their importance: Splits, bruises, thorn stabs, thrip scars, sunburns and worm holes. These six kinds of blemishes are responsible for upwards of 75 per cent of the culls.

Blemishes Caused by Insects.

In considering each one of these classes of blemishes, we find that the eleven insects affecting citrus fruits have been extensively investigated for many years, and effective means of control have been devised for most of them. The history of the long fight against scale insects, which has culminated in effective methods of fumigation, is familiar to all of you. The thrips problem, which has attracted much interest of late, is being investigated by the United States Department of Agriculture, and I understand that methods of control by spraying will soon be published. Generally speaking, therefore, the blemishes of citrus fruits caused by insects may be regarded as largely vegetable.

Fungous.

Under the head of fungous blemishes we find ten different fungi responsible, several of which are secondary or dependent on other blemishes. The most serious of these, such as brown rot and blue and green mould, have been exhaustively studied, and adequate measures for their control are at hand. Some of these, such as the gray mould, are quite rare, and worthy of passing notice only. Others, such as the wither-tip and sooty mould, are dependent either upon the special climatic conditions of certain localities or upon a weakened or previously diseased condition of the trees, or upon insects, which have limited distribution. In general, it may be said that the fungous blemishes are largely preventable, and that those which are not at present well understood are being investigated, with a fair expectation of a satisfactory outcome.

Mechanical.

Our list contains nine different kinds of mechanical injuries. These are practically all due to carelessness, and are largely preventable, the exceptions being shoulder spots and injuries due to hail. Such injuries as bruises from rough handling, cultivator scars, clipper cuts, stem punctures, etc., do not directly cause a large percentage of culls, for a large proportion of such injuries pass the graders unnoticed, and are packed and placed in the car, there to develop into decay. Mechanical injuries, therefore, are a great deal more damaging than the percentage of mechanically injured culls would indicate. It is only when we realize the enormous losses from decay in transit due to these injuries that their full significance is brought home to us.

Physiological.

The list of physiological blemishes is a long one, containing seventeen separate and distinct troubles, and the list is being constantly added to. Several of the blemishes causing heaviest losses, such as splits, puffs, bottle neck and brown spot, belong to this class. I wish to emphasize the fact that scientific knowledge concerning this class of troubles is exceedingly meager, as these subjects lie in a field in which scientific research into the

underlying principles has made but little headway. None of these troubles has so far been shown to be the result of insect or fungous work. They are due to peculiar climatic conditions, to an irregular water supply, or to unfavorable soil conditions, or to some obscure disarrangement of the nutritive, transpiratory or other natural processes carried on in the plant tissue. It is very easy, indeed, to propound plausible theories to account for these troubles, and this has been freely indulged in. The proving of these theories, however, is quite a different thing, on account of the great difficulty of reproducing the conditions under control. An adequate investigation of some of these troubles would require an effort extending through several years and a considerable amount of money, and all this with no assurance that a practicable remedy would result.

The causes and remedy for some physiological troubles are apparent to all without investigation. I refer to such things as sunburn and frost injury. Why some varieties should be more resistant to sunburn and frost than others is, however, much more difficult to answer.

In regard to exanthema, much evidence has been found which supports the theory that this disease is caused by sudden and sharp variations in the moisture content of the soil. In situations where the subsoil is composed of a layer of coarse, open gravel, the conditions are present for exanthema. It manifests itself by spotting and in some cases splitting the fruit. Splits resulting from exanthema are entirely distinct, and in no way connected with the blossom end split of the Navel orange.

Double or protruding Navels and fingered oranges are malformations arising in the blossom, due to obscure and unknown causes. Corrugations, bottle necks and heavily pebbled rinds are usually thought to result from sexual sports, and that the remedy for them lies in careful selection of buds and intelligent pruning. In some cases, however, they may be due to malformations of the blossoms.

The brown spot of the orange has received a great deal of attention at the Whittier laboratory. While a great many plausible theories have been suggested from various quarters, and much work has been done, the cause of this trouble has not as yet been found and proven. The investigation of this subject has been unusually difficult on account of the fact that the spot does not develop on the tree, but only after the fruit has been picked from ten to twenty days. For this reason, very little brown spot is seen locally, and the growers as a rule are not familiar with it. On account of the many different kinds of spots and blemishes, the reports of selling agents are seldom reliable. This spot affects only the surface of the rind, and is purely a physiological one, no trace of any fungus, bacterium or other parasite having been found in connection with it. It seems to occur only on Navel oranges, and is most prevalent during January. This year the losses from this spot were quite serious. The very finest quality Navel oranges may be picked and packed with extreme care, and shipped under a fancy brand, only to arrive in the East in a badly spotted condition. It not only results in the fruit being discounted, but it tends to destroy the reputation of our fancy brands. This is peculiarly irritating to the packing house people, for they know the oranges were not spotted when they left the state, and it is impossible to grade against it, unless, indeed, the oranges are stored for several weeks, which is clearly out of the question. You will, therefore, realize that the investigation of an obscure physiological problem of this nature is a great deal more difficult and time-consuming than that of a problem where some fungus, bacterium or insect is involved.

The stem end spot appears to be very similar to the brown spot in looks, but differs strikingly from it in that it develops on the tree as well as after picking, and the spots occur at or very near the button. This stem end spot has occasioned but little complaint until this year, when, on account of the continued rains, a common fungus, which is almost black in color, and which grows on dead tissue, has developed on these spots and in this way rendered them much more conspicuous.

Splits of the Navel orange have been very common this year, and it would seem that they are caused by some combination of circumstances, such as an irregular water supply, coinciding with extreme variation in the temperature and relative humidity of the air. So far, little but theory has been advanced to account for splits, and much careful work will have to be done before the cause or causes can be scientifically proved.

The pitaca and red blotch are both physiological diseases of stored lemons, the cause of which has not been discovered.

Summary.

I have outlined some forty-eight separate and distinct blemishes of citrus fruits which are at present operating to reduce the profits from the citrus industry. I have divided them into four classes, and shown that mechanical blemishes are practically all preventable; that insect and fungous blemishes have been extensively investigated, and that remedies for these troubles are either at hand or are in process of being worked out, with a reasonable expectation of success. I have shown, also, that the list of physiological blemishes is a long one, and that science has as yet made but little progress in discovering the cause or in finding remedies for this group of exceedingly complex and obscure diseases.

CITRUS Trees

If you intend to plant citrus trees

this year, your orders should be sent to us at once to insure getting the best stock.

ORANGES Washington Navel, Thompson's Improved, Valencia Late.

Eureka, Lisbon and Villa Franca. **LEMONS**

We offer the above in carload and less than carload lots. We have the finest and largest stock of Citrus Trees of all varieties in the state. Write for prices.

Deciduous Bush-Tree Fruits

PHOSPHATE IN MONTANA.

The withdrawal of the phosphate lands in Montana officially known as phosphate reserve No. 7 was made by an order of the president dated January 12, 1911, and is based on a recommendation submitted by the Director of the Geological Survey. A report by Hoyt S. Gale, a geologist of the survey, announcing the discovery of these beds, has just been issued. The lands thus withdrawn include about 33,950 acres.

Location and Character of the Deposits

The newly discovered deposits are situated in and near the canyon of Big Hole river, on the route of the Oregon Short Line, about 30 miles southwest of Butte. Analyses of samples collected from these deposits show the presence of some high-grade rock and the evidence obtained indicates its occurrence in beds of good commercial quantity. The deposits are like those of the southeastern Idaho and western Wyoming field, from which phosphate has been shipped for several years.

A Chance to Utilize Smelter Fumes.

One of the most important considerations in connection with the discovery of phosphate rock in western Montana is the significance it has as to the probable extent of the western phosphate fields, for it now appears probable that similar deposits may extend over a large part of western Montana. Their nearness to the large smelters where sulphide ores are reduced is important, for these smelters produce great quantities of sulphurous-acid fumes, which are usually allowed to go to waste through the smokestack of the plant. It is contended that these fumes destroy vegetation and menace animal life over a considerable area in the vicinity of the smelters and constitute a serious detriment to the locality generally. In recent years efforts have been made to compel the smelter companies to condense or otherwise dispose of the acid fumes, and a number of suits against the companies have been brought in various parts of the United States by the Department of Justice.

Reduction of phosphate rock by means of sulphuric acid appears to offer an opportunity to utilize what has long been largely or wholly a waste product at these smelters.

Method of Manufacture.

All the phosphate rock now shipped from the phosphate fields of the western United States is sent to the Pacific coast, where it is used in the manufacture of fertilizers. The rock is ground fine and then combined with sulphuric acid, which reduces it to a form in which the phosphoric acid is more soluble, thus rendering it more directly available as plant food. Nearly equal parts by weight of acid and phosphate rock are used in this process, so that large quantities of acid may thus be utilized. When the rock and acid have combined chemically the resulting product is known as superphosphate. This is then dried, so that it hardens into a porous mass which is pulverized and sold for direct application to the soil.

Prices of Phosphate.

As to the commercial value of rock phosphate in Montana probably the best evidence is the price paid for similar rock in the eastern fields. A summary of the values reported from nearly all the eastern fields for 1908 shows prices ranging from $4 to $5 a ton f.o.b. at the mine. Superphosphate retails at about $10 a ton in the East and at $17 or more on the Pacific Coast.

Markets for Phosphate.

The chief obstacle to the development of the western phosphate fields at the present time is the high cost of transportation of the bulky fertilizer products and the lack of markets sufficiently near to warrant their development. Much of the agricultural land of the western states is relatively new and as its original phosphates have not been exhausted by cropping it is less in need of fertilizers than the older farm lands of the East and South. The use of fertilizers on the Pacific Coast is said to be increasing fast; also in some other parts of the West where intensive farming is practiced. There will henceforth probably be a rapidly growing market for fertilizer product in the Middle West and it is to this territory also that the western phosphate producers must look for markets.

Value of Fertilizers.

The experience of foreign countries whose soils have become exhausted by long-continued use shows the importance that will some day be attached to our own phosphate resources. For the present, our phosphate fields will probably be developed in accordance with the increasing demand, and this growth must depend to a large extent upon an intelligent understanding of the value and the proper methods of using such fertilizers.

CANCER IN PLANTS.

The Department of Agriculture has in press a bulletin entitled "Crown Gall: Its Cause and Remedy," which promises not only to revolutionize present views respecting the nature of various overgrowths in plants, but also to throw light on the cancer problem in men and animals.

This bulletin deals with a widely distributed and harmful disease of orchard trees and other plants. This disease is commonly known in the United States as crown gall, but it may occur not only on the crown of plants, but on roots and shoots.

The disease has been known for a long time, and under the supposition that it was infectious and injurious, various states have made quarantine laws against it. The disease has been ascribed to various causes, without satisfactory proof, and many persons have been led to believe that it was not due to any organism. The experiments detailed in the bulletin show clearly that the gall is due to bacteria and is infectious, being readily transmitted not only from plant to plant of the same kind, but also to many plants of widely different families. The bulletin shows that the growth is not only of itself injurious to the plant, but also may form an open wound through which other parasites are likely to enter, such as the fungus of root rot, and the bacteria which cause blight of apples and pears.

The bulletin recommends that the inspection laws now in force in the various states be continued and enforced. It shows what plants it is not advisable to use as a crop following a

galled one. It describes the life history and cultural characters of the organism involved, points out the difficulties through which it was isolated and identified, gives numerous illustrations showing the nature of the tumors produced and the time involved in their production when pure cultures of the organism were used, shows that the organism has a wide range of host plants, and that the overgrowths produced are in many ways, anatomically and otherwise, strikingly like those found in certain malignant animal tumors.

The cause of cancer is unknown, and a majority of animal pathologists at the present time are inclined to regard it as non-parasitic, chiefly, however, because no parasite has been found. The bulletin shows that a similar argument might have been advanced with equal force some years ago against the parasitic nature of crown gall. No good reason can be adduced why cancers should not occur in plants as well as in animals, and if these plant growths are truly cancers, then it is extremely probable that micro-organisms of some sort are also the inciting cause in sarcoma and carcinoma. Tubercle diseases occur in plants as well as in animals, and superficially they resemble these growths, but not structurally nor in the groupings of the parasite.

The bacteria causing these plant tumors are not abundant in the tissues, sometimes very rare; are hard to see and difficult to stain; they perish readily, both in the tumor and in culture-media; are difficult to cultivate from the tissues unless one knows the technique; do not form abscess cavities after the manner of the tubercle diseases, but multiply in limited number within the tissues and apparently only inside the cells which their presence stimulates into rapid division. The disease metastasizes readily, and on this account is cut out with difficulty. The organism loses virulence easily both inside the tumors and in culture media, and finally if the plants are not destroyed by it they seem to acquire a partial or complete immunity.

The bulletin should not only be of very great importance to the orchardist and grower of hothouse plants, but also to all specialists who are interested in the cancer problem, inasmuch as in the present uncertain state of research on that disease any clue whatsoever becomes of importance. It is not claimed that the organism here described is itself the cause of malignant animal tumors, but only that in many respects the growths produced by it are suggestive of malignant animal tumors, and that probably some similar parasite lies at the bottom of the malignant phenomena of such growths. The bulletin involves teamwork done by four people in the Department of Agriculture, covering a period of six years, and the total number of experiments involved amounts to thousands.

ONE OF THE DELIVERY WAGONS OF THE GERMAIN SEED CO., LOS ANGELES.
It seems to be well loaded.

FUNGICIDES AND INSECTICIDES.

One of the neatest little books we have seen issued in some time is "Fungicides and Insecticides," a handbook for the agriculturist and fruit grower, giving short descriptions of various fungous diseases and insects of common occurrence, containing also formulas for preparation of sprays and directions for time of spraying. It is compiled by Arthur R. Maas, chemist of the Braun Chemical Company, which concern issues the book. It has 70 pages, every one of which is filled with a concise fund of information. A few advertising pages are added, but in no way spoil the beauty of the book.

The plan of presenting these valuable facts is very similar to that used in the Cultivator in its issue of November 3rd, which treated so fully of sprays and time of application. Many illustrations add to the value of the text, most of them half tones. No price is named on the book, but it is altogether too expensive a one for general distribution. Information regarding it, also the chemicals named in the formulas, may be obtained by writing the Braun Chemical Company, 906 East Third St., Los Angeles, Cal.

TREES ***of all kinds True to Name***

We call particular attention to the varieties named below, of which we have a fine stock and offer exceptional values.

Walnuts

Finest French and English Softshells.

Greater interest than ever is being manifested in the growing of this profit maker on the Pacific Coast, where ideal conditions exist for producing nuts of the highest quality. We are most fortunate in still having a stock of perfectly healthy, well grown trees, and are prepared to make prompt delivery.

DON'T FAIL TO GET OUR PRICES AND WRITE US FOR INFORMATION.

Figs

Calimyrna, the genuine Smyrna Fig of Commerce, the Mission or California Black Fig, the White Adriatic.

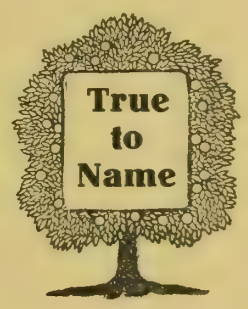
Special inducements on these trees in small or large quantities. Our trees are in A-1 condition, and can be shipped immediately on receipt of order.

Your Collection is Incomplete without Figs.

Pomegranates

"The Wonderful"

This variety holds the record for the most attractive fruit for table decoration, as well as being eagerly sought after for its delicious eating qualities. Eastern shipments have brought handsome returns to the producers, and as the trees are easily grown and yield early, no one can afford to miss this opportunity to get some of the trees started right now.



Peaches

ELBERTA, FOSTER, LOVELL, MUIR, PHILLIPS' CLING, RUNYON ORANGE AND TUSCAN CLING.

Prunes

GERMAN, HUNGARIAN, ROBE DE SARGENT AND SUGAR.

Plums

BURBANK'S "FORMOSA," BURBANK CLIMAX, GIANT, GRAND DUKE, IMPERIAL GAGE, JEFFERSON, KELSEY JAPAN, "SANTA ROSA," SATSUMA, WICKSON, YELLOW EGG.

All these trees are heeled in, in our packing grounds, and can be packed and shipped with dispatch. The trees are all in excellent condition and perfectly dormant.

The planting season was never more favorable and this is a grand opportunity for persons who have been unable to plant earlier, to secure the finest stock at remarkably low prices. Write or wire us TODAY about your requirements and take advantage of this timely offer.

GERMAIN'S SEEDS ERMINATE

You can buy no better seed than that sold by us, and we are always glad to assist you in selection. Among other extra fine varieties that we recommend are the following

Three 1911 Specialties

CASAD'S Improved Muskmelon
A distinctly new sort that has been firmly established. Slightly netted rind, buff yellow flesh, luscious and smooth, approaching a pineapple flavor. Send for a packet 25 cents.

GIANT Stringless Green Pod Beans
This is a big favorite in the East and has proven a success here. It often produces pods six inches in length, tender and absolutely stringless. Very early. Packet 10 cents. Pound 35c postpaid.

GERMAIN'S Winter Queen Tomato
It is the earliest producer of all, and shows a wonderful resistance to frost. Compact bush, fruit smooth, even sized and finely colored, firm flesh. Packet 10 cents. Ounce 50 cents.

You should have our 1911 Catalogue—Please Mark Letter Dept. C

Garden and Field Crops

SPANISH ONION GROWING.

Spanish onions are in great demand in the United States. In fact, last year 412,000 boxes were imported here, 146,000 more crates than were sent in the preceding year. In view of the increasing demands from the United States for these choice onions, Consul Frazier of Valencia has sent in the following directions for their cultivation. It was written by a practical farmer in his district and ought to prove of interest to the California onion grower, as the climatic conditions and soil are much the same as those of Spain. These instructions are applicable principally to the mild, red-tinted, oval onions, which are generally small in size and which resist the long sea voyages much better than the large, soft, whitish, flat onions harvested early in the season.

Spanish Cultural Methods.

The soil destined for onion-seed beds should be well charged with organic fertilizer, preferably humus resulting from previous manurings, because fresh cattle manure is objectionable for onions in many ways, and may even lead directly to rotting the bulbs. The seed should be sown in the proportion of ten grams to the square meter (equivalent to 0.353 ounce per 1.196 square yards, or at the rate of about ninety pounds to the acre) and covered lightly with finely pulverized earth, or with dry, fermented and powdered manure. A small empty barrel or similar light roller is passed over the seed bed to slightly press the earth and facilitate germination. The soil intended for the transplanted seedlings must be carefully broken and reduced to a uniform consistency.

With the last plowing, and about fifteen days before transplanting, the following fertilizer may be sown broadcast: Lime superphosphates (strength 18-20), 440 pounds to the acre; potassic chloride, 310 pounds to the acre. These figures for potassic compounds may appear rather high, but it should be borne in mind that the object is to produce a firm, keeping onion of medium size.

When the nursery plants are about six inches high, they should be dug out with spades, and the uprooting facilitated by previously moistening the soil by a very light irrigation. The points of the roots and the tips of the plants should be removed with scissors. Planting is performed with dibblers, the bulb being barely buried beneath the surface and four to five inches separating each plant, according to the size of the onion desired.

The Growing Period.

The laborers engaged in planting press the earth firmly with the hand around each bulb to bring the roots into immediate contact with the soil. After the plants have taken root 330 to 400 pounds of nitrate of soda to the acre should be sown over them, but this quantity should not be exceeded, to avoid too great development in size.

During the whole period of growth the onions must be kept scrupulously clean of weeds, which, under the influence of sun, air, fertilizers and irrigation, multiply with alarming rapidity.

The number of irrigations should be limited to what is absolutely necessary, taking into account the natural moisture of the soil and the rainfall. The first irrigation should be applied immediately after transplanting, and the last one some three weeks before harvesting, in order to give the crop time to absorb and assimilate the water, and acquire the necessary firmness and consistency before uprooting.

A few days before harvesting, the onion tops should be rolled flat to aid in maturing and seasoning the bulbs by greater exposure to sun and atmosphere. Onions intended for storing should be carefully cleaned of all adhering earth and organic matter, which would interfere with their conservation.

Irrigating Practices.

In the opinion of Valencia farmers, no other crop grown there robs the soil of such an extent of the constituent elements of its own growth, and no other will yield such poor results the second year if repeated on the same land.

The choice between planting in furrows or on flat surfaces depends on the abundance or scarcity of irrigation. Long experience proves that water, when scarce, goes much farther in irrigation in furrows than in flooding practically the whole surface of a field planted on the level.

However, where irrigation is abundant, the great majority of onion growers prefer flat planting, as they believe that this method favors the crop in resisting the great heat and dry winds common to this region during the summer months. For irrigation purposes, in flat planting, the land is divided into strips two or three yards wide, and as long as the level of the ground will permit, surrounded by a low ridge to contain the irrigation water.—Consul Frazier of Valencia.

Pioneer ROOFING
—best by every test

The Popularity of **Pioneer Roofing** is due to its **wearing** qualities. We want to go on record right here and now with the positive assertion that a "Pioneer Roof" will outlast **two** ordinary roofs. The first cost is little if any more than you would have to pay for roofing of inferior quality. And once a "Pioneer Roof" is on, there is no further cost. It requires no paint or repairs.

Pioneer Roofing is made in several weights; suitable for residences, hotels, outhouses, business blocks; anywhere that a sunproof, rainproof roof is required. Comes in handy rolls. Easy to lay. No special tools needed. Everything necessary will be found in the center of each roll, for which there is no extra charge.

Free Booklet and Samples
The mauufacturers of Pioneer Roofing have published a 32-page booklet, which is effectively illustrated. The booklet is both interesting and instructive. It tells how to lay roofing—and what weight or thickness of roofing is best suited to the various kinds of buildings. The booklet and samples of roofing will be mailed free upon request.

Pioneer Paper Co.

Los Angeles, California.

If your dealer does not carry Pioneer Roofing—notify us, and we will see that you are supplied. Address Dept. 11.

Home Grounds Beautiful

SANITATION IN THE FARM HOME.

"Living in the country" should, of right, be the panacea against all diseases arising from impure air, impure water and adulterated or unfit food. But, population considered, there would appear to be little difference in the extent to which such diseases prevail in country or city. As says a contemporary:

"Every case of tuberculosis, city or country, proves that with pure air 40 miles deep over our heads we have chosen to breath impure air. Every case of typhoid fever—and we cannot deny that the farm home has them—proves that the drainage from stables or outbuildings has somehow gotten into the well, or that our worst enemy, the common housefly, has washed his dirty feet in our food. Every case of diphtheria proves that filth is not far off."

Lack of ventilation in sleeping and living rooms—a superstitious dread of cold air—is probably responsible for a large majority of the cases of tuberculosis occurring on the farms. People who sleep practically out of doors—that is, with windows wide open—seldom contract tuberculosis. So long as the bed is warm, it matters little how cold the room is. The arctic traveler, ensconsed in a fur sleeping-bag, and with no canopy but the stars, takes his rest under almost ideal conditions. The Eskimos never have consumption until brought south and compelled to live in houses like ours.

Typhoid fever will never originate on a farm if the water supply is kept pure. Such purity is assured by the "driven well," sunk deep enough to be secure against the contamination of surface drainage. And it often happens that such a well is cheaper than a dug well, the security of which against seepage from barns and outhouses is always a matter of doubt unless tests have proven that the drift of contaminated under-surface waters is away from and not toward the well.

As for the house fly, the protection of the house by screens over doors and windows, and the quick removal to the fields of the manure heaps, of which it breeds, will add not only to the healthfulness but to the general comfort of the home.—C. R. Barns, Minnesota University Farm.

BEAUTIFYING HOME GROUNDS.

Samuel Armstrong Hamilton has given some good suggestions about planting to beautify the home yard in the Woman's Home Magazine, which are very applicable to conditions on the coast, except that we have great advantages in our evergreen vines and shrubs, ornaments in themselves when properly placed.

It will always be the case that there are some features to be concealed, and some to be beautified and improved. The first must be considered. Is there a tumbledown fence, a rickety old building or outbuilding to cover or conceal? A neglected summer house to cover, or trellises to restore to their former state of beauty? If so, they demand the first attention. Use some of the quick-growing annual climbers, as the Wild Cucumber Vine, Cobaea Scandens, Cypress Vine, Dolichos, Morning-glory, and any of the ornamental gourds. Any of these planted as late as the first of June in very rich soil and kept freely watered will make a quick growth, and by the middle of summer make a fine showing. If the soil is not naturally of the best for these vines enrich it with one-third its bulk of well-rotted cow manure, and run the spade down deep in digging, even if some of the subsoil comes up with it.

The next thing to consider is the matter of screening, and the making of an imitation shrubbery. If the back yard or vegetable garden is unsightly, or it is desired to cover any feature of the garden with a screen, plant rather closely (a foot apart) Ricinis, or Castor Bean. These must have soil the same as the climbing vines, and in addition be well mulched as soon as the dry season arrives, and they will require a great quantity of water to stimulate them into quick growth. By midsummer they should form a screen or hedge, or whatever shape they are planted in, six feet high, and impervious to the sight.

Of course, in the meanwhile the garden beds and borders have been laid out. One of them, in some out-of-the-way place, but in a sunny location, must be kept for a nursery bed in which to start the young seedlings, while the others will be given temporary blooming plants, to cover them while the young plants are maturing. The best plants with which to get the earliest covering bloom are the Marguerite and Dianthus Pinks.

The soil for them must be very rich and porous. Aerate it well by turning it as it is dug and raked, and at once plant it broadcast with a mixture of Marguerite and Dianthus seed, which should be lightly raked in, be well rolled or patted with a board, and then thoroughly watered with a fine spray nozzle.

In four weeks the beds should be a mass of fine fragrant blooms, a perfect riot of shades and colors, with which you will be loth to part, but they must give way to the regular bedding plants later on. The principal difference between this kind of a garden and a regular one is that the time of planting out bedding plants is set forward six weeks, while we use a cover crop in the meanwhile.

GLADIOLUS.

One of the best summer flowering bulbs is the gladiolus. The bulbs may be purchased from any reliable nurseryman or seedsman. They should be planted about the same time sweet corn is planted, and given much the same cultivation as any other garden crop. Plant three to four inches deep in rows thirty inches apart, and six or eight inches apart in the rows.

The blooms may be cut when the first bloom opens, and the buds will continue to open for a week or two, if placed in water. At the end of the growing season, dig and dry the bulbs until the bulbs and bulblets can easily be separated. Store in any cellar where they will not get wet or dry out. The small bulblets may be saved and sowed like peas in the spring, producing flowering plants in about two years.—LeRoy Cady, Minnesota University Farm.

Fresno business men are making big preparations for a raisin day campaign April 29. Eight thousand dollars has already been secured.

THE NATIONAL ORANGE SHOW.

It is not often that California grumbles at rain, but last week the management of the National Orange Show at San Bernardino, felt it had real cause for a grouch at the weather man; it had rained much of the week before and the opening night found a drizzle still coming, and it continued for more than half the week of the show; the close was, however, under smiling skies. The show was opened on Monday evening by signal from the office of Governor Johnson in Sacramento, and from that time on to the end the attendance was fair though the storm prevented the immense crowds which would have been there if the weather had been favorable. Every evening audience was large. The tents in which the exhibits were made leaked most distressingly; some exhibits were ruined and all were more or less injured, but with it all, the true spirit of boosting for everything citrus obtained, and everybody was happy.

Instead of being held in the usual pavilion, one paved street was closed and tents erected over the pavements, making an excellent exhibit place. There were two large tents, one given over to citrus exhibits, the other to mechanical appliances. The central feature of the latter tent was a fully equipped packing house in operation, with box-making machines, brushers, sizer, press for putting down box lids, and several girls packing. The packing house was in operation for a purpose, for one of its features was taking orders for California oranges to be delivered to any part of the East at shippers' prices, all charges paid Other exhibits in the mechanical tent were orchard ladders, clippers, new appliances for brushing, cement coated nails, and a long line of orchard working implements. Fertilizer companies were present with complete exhibits. The pathological laboratory at Whittier had a fine exhibition which was nearly ruined by the storm. It consisted of fruit from the orchards showing various blemishes and injuries, and alongside were the insects or fungi which caused the trouble. Two high-power microscopes were on hand so that Prof. Smith, Dr. Coit, and assistants, could make examination of citrus troubles and give expert answers on the ground. Had it not been for the rain affecting this exhibit so seriously, it would have been one of the most valuable made.

The exhibits were beautifully arranged and in the construction of feature exhibits but little low grade fruit was used. In quality exhibits and commercial packs we do not believe the equal was ever brought together, though the Los Angeles shows of several years since were made up of greater quantity than this:

The awards were as follows:

Best 25 boxes of oranges—Sweepstakes, loving cup, goes to the Highland Orange Growers' Association; second, banner, Gold Buckle Association of East Highland; third, banner, Etiwanda Exchange.

Best 25 boxes of oranges—Sweepstakes, loving cup, goes to the Corona Chamber of Commerce; second, banner, Rialto Packing Company.

Best feature exhibit—First, $50 cash, Gold Buckle Association of East Highlands; second, banner, Rialto Chamber of Commerce; third, banner, Redlands Board of Trade.

Best five-box lot of oranges—First, loving cup, Highland Orange Growers' Association; second, banner, Gold Buckle Association of East Highland; third, banner, West Highland Citrus Association.

Best five-box lot of lemons—Banner, Etiwanda Exchange.

Best five-box lot of Seedling oranges—Banner, M. C. Mascart of Redlands.

Best single box of oranges—First, banner, Highland Orange Growers' Association; second banner, Gold Buckle Association of East Highland; third, banner, Etiwanda Exchange.

Best box lot of Valencias—A. F. Leightfuss of Orange.

Best single box of lemons—First, Corona Chamber of Commerce; second, Arlington Heights Fruit Company of Riverside; third, Gold Buckle Association of East Highland.

Best single box lot of grape-fruit—First, Gold Buckle Association of East Highland; second, A. C. Denman & Son of Redlands Junction; third, Alta Cresta Groves of Riverside.

Best packed box of oranges—First prize, a loving cup, Rialto Lemon & Orange Association; second, Gold Buckle Association of East Highlands; third, Highland Exchange Association.

Best packed box of lemons—First prize, a loving cup, Arlington Heights Fruit Company of Riverside; second, Gold Buckle Association of East Highlands; third, Etiwanda.

Best tray of 25 Washington Navels—Highland Orange Growers, Association.

Best tray of 25 Mediterranean Sweets—E. C. Wilson of Etiwanda.

Best tray of 25 St. Michaels—E. C. Wilson of Etiwanda.

Best tray of 25 Bloods—Riverside Trust Company.

Best tray of 25 Seedlings—Montague C. Mascart of Redlands.

Best tray of 25 Tangerines—Priestly Hall of Riverside.

Best tray of 25 Valencias—A. C. Denman & Son, of Redlands Junction.

Best tray of 25 oranges — First, Highland Orange Growers' Association; second, Bloomington Fruit Association; third, Highland Exchange Association.

Best tray of 25 lemons—Riverside Orange Company.

Best tray of 25 seedless grapefruit—P. T. Carter of Moreno.

Best tray of 25 seedling grapefruit—A. C. Denman & Son of Redlands Junction.

Best tray of 25 Washington Navels grown in the city of San Bernardino—J. N. Corbett.

Best tray of 25 seedling oranges grown in the city of San Bernardino—John Brown, jr.

Best exhibit of Citron of Commerce—Sparr Fruit Company of West Riverside.

Best exhibit of Navel Bloods—Riverside Trust Company.

Best exhibit of navel grapefruit—R. C. Hunt of Rialto.

Best exhibit of Kumquats—James Dickson of Rialto.

Best exhibit of Pearlines—James Dickson of Rialto.

Best exhibit of products manufactured from citrus fruits—Kingsbury Fruits Incorporated, Redlands.

Largest orange—W. H. Pettibone of Redlands.

Large grapefruit—A. C. Denman & Son of Redlands Junction.

Best exhibit of citrus nursery—First, H. H. Linville of Highland; second, Tetley, Merriam & Childs of West Riverside; third, M. C. York of Highland.

RUBBER.

Rubber has many peculiarities in its crude state, according to P. W. Litchfield, general superintendent of the Goodyear Tire & Rubber Company.

"The crude rubber we get from Ceylon comes in entirely different form from what we get from Brazil," stated Superintendent Litchfield during an interview at the factory. "Yet it is the same kind of rubber—Para rubber—and of practically the same quality. Seeds of the Hevea tree, which produces the Brazilian Para rubber, were taken to Ceylon some years ago and planted in soil very similar to that to which it is indigenous in the valley of the Amazon.

"Some day these young trees are going to be just as good as those in the Amazonian forests, and in the trade it is believed to be only a matter of time when what is called the cultivated rubber crop will be sufficient to supply the needs of the world; and probably at a much lower cost than manufacturers have been paying.

"In 1908 this cultivated crop of rubber from Ceylon did not exceed 2000 tons; the next year it was 4000 tons; last year it had grown beyond 8000 tons, and this year's crop is estimated as likely to reach 14,000 tons. A few years hence the cultivated crop will equal the wild or natural crop of South America."

There are over 15,000,000 acres of national forests within the state of Arizona.

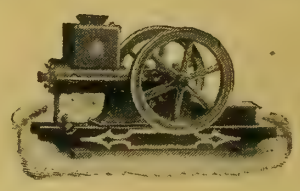
THE EMPIRE LINE



Quality, Quality, QUALITY! Do you know this goes hand in hand with the EMPIRE Cream Separator? It stands for high rank, you cannot afford to put your money into a cheap Cream Separator any more than you can afford to buy a poor cow; you know many cows would be cheap at $100.00, and others dear at $25; there is just as much difference between a good and poor cream separator. In the EMPIRE you get Quality the same as in a good cow; it may cost a little more when you buy, but it is cheaper in the long run. Try one for ten days and be convinced. If no agent at your place, write us for terms and prices. We will treat you right.

THE PIGS.

By Mrs. M. E. Sherman.

A morning paper gives the records of the amount of hogs dressed for food during the year 1909 as 36,443,000 while the grand total of all animals used for food was 68,403,000. These returns coming from packing and slaughter houses naturally fall below the real count. The farmers butcher twenty hogs to one beef, taking the country at large.

The importance of the hog industry makes it deserving of better planning on the part of the farmer. The present careless way of placing the hog house on a convenient patch of bermuda or salt grass or in some tule swale, without regard to the surrounding fields is not the best way. The labor may make it costly, when the hog lots are not arranged to make the feeding as little labor as possible. While the bermuda assures them of a dry place in the winter time and they do enjoy rooting it, when the ground is soft, still it is not an economical way to clean the land, as some seem to think. The bermuda grass enjoys it rather than resents the intrusion of piggy's snout as a cultivator. The next season it shows up more smiling and green for the winter's experience.

The Land.

Twenty to forty acres in a square or in a long piece makes a system of handling possible. The land is fenced and cross-fenced, using good hog wire, making two central homes for the brood sows and the boar. Shade trees, poplar, willow or other tree that loses its leaves in the winter is desirable. In California the sun should shine into every corner in the winter time, and be well screened by leaves in the summer if the pigs are to be kept healthy.

Five lots or the double of this gives the best results. One lot has the houses, including the brood sow's homes, the feeding troughs and water in it. The home for brood sow is built and subdivided according to the owner's ideas on this matter. The other four lots are planted for feeding the pigs. Let us number them one, two, three and four, for convenience. Sow lot No. 1 at once to alfalfa; lot No. 2 with oats and peas; lot No. 3 in barley, and lot No. 4 in peas. Use the common tall growing varieties of garden peas for this purpose, drilling them into well plowed soil a couple of inches deep. As soon as the barley on No. 3 is well up, turn the pigs in for a few hours every day. When this is eaten off the oats and peas in No. 2 should be ready to feed. Plow lot No. 3 which has been fed off and sow to sweet corn. When the oats and peas are eaten off No. 2 sow that lot to sorghum and use the peas in lot No. 4 for feed. When lot No. 4 is eaten off the alfalfa stand should be ready. It is not well to pasture this the first season but cut and feed over the fence. When the peas are off lot four it is sown to sorghum. The sweet corn on lot three can be planted to either pumpkins or pie melons after the sweet corn is off, for later winter feeding.

Care.

Naturally this sowing plan can only be suggestive but the above gives a good set of crops that are easily grown. The lots used for this feeding off will pay well the first season if a little commercial fertilizer is used on them, particularly on the corn and peas. After the first season the droppings of the pigs will enrich the land enough to render fertilizing unnecessary. All these crops are intended to be fed off, not cut, and this adds to the cheapness of the harvesting. This way of handling is on irrigated lands, where water is under control and abundant all year. Sorghum, when it is two feet high, will carry as high as thirty hogs to the acre for a short time, while an acre that is well irrigated will feed twenty growing pigs for a long period, often two to three months. When feeding sorghum it is well to balance the feed up with a little cut alfalfa or with some alfalfa hay, as all sorghum makes an ill-balanced food for growing animals.

Feeds.

The only feeds needed when hogs are handled in this manner are the usual ones of skim milk and rolled barley for the nursing mothers. These should be kept away from the stock hogs and a little green stuff fed them every day. Now, as fencing costs money, it may be well not to fence off the land into these smaller fields until the ability to produce good pigs has been tested out. When the dairy is combined with the pig raising, the crops may be grown in a larger way and cut and hauled to the pigs and cows alike. The other way is to have two of these small sets of lots and use them alternating for the hogs and calves and colts. During the winter time the sows must be kept in good order but not allowed to grow over fat. After the pigs are weaned give plenty of alfalfa hay with a little rolled barley and abundance of pie melons. The growing pigs should have soaked corn or rolled barley in the skim milk.

Barley.

We have been a long time in finding out that barley had a high value when fed to pigs. A gain of one hundred pounds in weight from four hundred and thirty pounds of rolled barley when fed with one hundred and ten pounds of skim milk, has been made. The rolling of the barley helps, for when the same amount was used, fed unrolled or whole, it took five hundred and forty pounds to produce a hundred weight of live pork. In comparing corn to barley it was found that by adding half corn to the barley, a quarter more growth was gained on a fifth less feed. Rolled barley fed with alfalfa hay gave better results than corn and alfalfa hay. It took four hundred and sixty-nine pounds of barley and fifty-nine pounds of alfalfa hay to gain a hundred pounds in weight. While another lot required five hundred and fifty-six pounds of corn and seventy-four pounds of alfalfa hay, rolled barley and alfalfa hay, therefore, will make a profitable feed for pigs on the ranch during the winter season if no provision has been made to pasture them in small lots.

Healdsburg will plant prunes to a greater extent than for some years.

THE PERCHERON SOCIETY OF AMERICA.

Has just taken over all records and business of Percheron Registry Company of Columbus, Ohio. 215 breeders took membership in P. S. of A. during December and January alone. 137 more new members added thru recent acquirement named above. There is now but one recognized Society in the United States recording Percherons. For information address WAYNE DINSMORE, Secretary, Union Stock Yards, Chicago, Ill.

HYGIENE OF THE FOOT OF THE HORSE.

The teeth and the feet of the horse should receive special attention, for without these in a good healthy condition the animal's usefulness is in a large measure destroyed.

Many horses are so vicious or irritable that they will not allow anyone to examine their feet, to say nothing of cleaning, trimming or shoeing them.

The colt at pasture should have its feet cared for as closely as the matured animal, in order that he may grow to maturity with feet in a healthy condition. The foot of the colt grows so rapidly that the wall will often project far below the sole and cause it to split and form quarter and toe cracks. It is better to use a pair of hoof cutters and rasp, and have the feet pared evenly and avoid unbalancing the animal.

Any horse used on the road or street should be shod, but the shoes ought to be changed every five or six weeks and the feet trimmed in order that the natural growth of the wall may be removed. If the shoes are improperly allowed to remain on the feet for two, three or four months, and in some cases a year without changing them, the wall becomes excessively long and grows over the shoe. Pressure becomes too great on the sole and bars, resulting in corns, bruised soles and lameness.

A hoof hook should be included among the equipment of a well regulated stable. The feet of the horse should be cleaned every morning before he leaves the stable. The hoof hook will remove all litter, pebbles, or anything that may have become lodged in the foot. This precaution may prevent injury to the sole or sensitive structures of the foot. If the feet become very dry, pack them daily for a week with some form of clay. Then apply lard to the wall, to which may be added pine tar and rosin. This ointment holds the moisture in the feet and prevents further evaporation. —C. L. Barnes, Colorado Agricultural College.

DRIED BEEF.

The round, or other tender, lean portion of beef is best for drying. For curing 100 pounds use 5 pounds fine salt, 2 ounces saltpeter, and 1½ pounds granulated sugar. Mix all thoroughly, and rub the meat with one-third of the mixture each day for three successive days. Let the meat lie in a large jar for a week, leaving the liquid which forms from the meat's juices until the meat is cured. When cured, remove from the jar and hang up to dry.

After meat is smoked it may be kept indefinitely in a dry, cool, dark place, where insects cannot get at it. A dark cool room in an attic is a good place. A coating of pepper rubbed over the meat will aid in keeping flies and other insects away. Hams and bacon may be closely wrapped or sewed in cloth, which may then be given a coating of whitewash or lard. Hang up in storeroom so that pieces do not touch one another, or a mouldy spot will form where they touch. They will also keep well wrapped in cloth and buried in oats or other grain or in salt.

Self-knowledge, self-reverence, self-control,
These three alone lead life to sovereign power.
Yet not for power, power of itself would come unasked for,
But to live by law, acting the law we live by without fear.

—Tennyson.

SAND IN THE STOMACH.

By F. G. Matthews, V.S.

A year ago we lost three horses by pasturing on sandy soil while feed was short. They were on short green pasture all winter as we did not realize that injury would come of it. We noticed our horses were getting poor in flesh and lost spirit as well, acting "all tired out" and could stand to work only a few hours when they would begin to shake and be covered with sweat from the lightest work. At times they would act colicky, roll and lie on their backs with their feet in the air. One day we noticed one of the horses would go every little while and roll, get up and go to eating again, then repeat. Next day all the symptoms of spasmodic colic developed, and we treated him for same but he died in about two hours. Desiring to find out, if possible, what was wrong, an examination was made and a quantity of sand weighing about 25 pounds was found in the stomach. The sand completely obstructed the outlet of the stomach.

We then started to physicking the other horses with quart doses of linseed oil twice a week, but one was so far gone she died about two weeks later and we found her stomach in the same condition. We saved one colt of Percheron breed. He passed sand with every movement of the bowels for four weeks. Neighbors lost horses and cattle. One party lost six calves and when the sixth died he decided to investigate and found a sand ball in the stomach. Another party had eleven horses affected.

The Percheron colt we saved did not thrive, weighing only 900 pounds at two years and four months old. And it is only since getting him free from sand that he is beginning to grow."—Subscriber, Ripon.

This is indeed an interesting report, as it deals with a trouble which has engaged very little attention at the hands of veterinarians. At any rate, few reports on the subject have appeared in our veterinary publications. An occasional complaint has reached the experiment stations of the Southern states and these come from the sandy soil belt bordering the Atlantic and Gulf coasts.

Pasturing stock on loose, sandy lands and on grasses the leaves of which spread upon the ground results in the ingestion of varying quantities of sand. In case the soil is so loose the grass is pulled up by the roots in the act of grazing, more or less of the earth adherent to the roots finds its way into the stomach and it is easy to realize how the accumulated sand would have a detrimental effect. Even if fatalities did not follow, digestion would be hindered, resulting in a weak and unthrifty condition and retarded development in young growing animals.

It is said that Shetland ponies pass sand for some weeks after they are taken from the islands.

Horses which arrive in the markets with their front teeth worn short evidently from having grazed on sandy lands, usually present evidence of having passed an unthrifty existence and some remain constitutionally weak and unfit for hard labor. Hence the subject is of considerable importance, especially in districts where irrigation is practical and also where animals range on sandy soils producing short, scant herbage. Some in-

vestigation along this line with the object of enlightening the breeders of livestock who happen to be so situated would certainly be time and effort well spent. The remedy employed by the correspondent, linseed oil in quart doses twice a week, is admirably appropriate. However, cottonseed oil will serve the purpose equally well and is less expensive. The treatment might be improved by adding a half pint of castor oil which would stimulate the bowel to more vigorous action, thus aiding the lubricant in expelling the irritant. Mild laxatives, repeated often, are preferable to vigorous purgatives.

Veterinary

Answers in this column by Dr. Fred G. Matthews, are without charge. For immediate mail answer remit $1.00. In writing questions give full symptoms or particulars of injury of animal.

Sow Vomiting.

Since weaning her second litter of pigs four weeks ago, a sow vomits soon after taking food. The vomiting occurs after eating either kafir corn or green alfalfa. The belly is drawn or "tucked up" in the flanks.—Subscriber, Visalia.

Where the act of vomiting occurs after feeding and during the time the stomach is in motion, we infer that some irritation within the stomach is the cause. This may be due to some foreign body accidentally swallowed, or the lining membrane of the stomach may be ulcerated. Steep one pound of linseed meal in a gallon of hot water and stir a pint of this into a feed of slop twice daily. Feed on slop free from solid particles. Start treatment by giving five ounces of Epsom salts as a purgative.

Worms in Horse.

Please give a remedy for worms in horses.—Subscriber, Ontario.

Starve the horse twenty-four hours, then administer three ounces of turpentine mixed thoroughly in a quart of raw linseed oil or sweet oil. Beginning four days later, give three times daily in the feed one heaping teaspoonful of a powder containing gentian, nux vomica and fenugreek, of each two ounces, and dried sulphate of iron three ounces.

Water Blister (Cyst or Abscess?)

Kindly advise a remedy to remove a water blister from my horse's shoulder, other than firing or lancing. It is located high up on the shoulder and was caused by an ill-fitting collar.—Subscriber, Arroyo Grande.

Collections of straw colored fluid under the skin are known as cysts and often result from bruises from the collar, blows, etc. It is my experience that they seldom appear above the upper third of the shoulder. In the region of the withers collections more often contain matter or pus and when opened may result in a fistula. Lancing a cyst is not a serious operation, however, and if not opened and drained properly they disappear very slowly. Blister the enlargement with red mercuric iodide, one drachm, mixed in one ounce of lard or vaselin. After two weeks repeat if necessary. —F. G. M.

Trade in Your Old Separator for a New DE LAVAL

More than 15,000 users of inferior and worn out cream separators of various makes traded them in last year on account of new **DE LAVALS**, and doubtless there are many more owners of such machines who will be glad to know that the DE LAVAL Company still continues to make liberal "trade" allowances for them.

While these old machines have little actual value to the DE LAVAL Company, as the machines thus taken in trade are broken up and "scrapped" for old metal, such exchanges afford a practical example of the difference between good and inferior separators, and add to the prestige of the DE LAVAL in the neighborhood.

Now that you will soon be milking more cows, why not take advantage of this liberal offer? **See the nearest DE LAVAL agent,** and he will tell you how much he can allow on your old machine toward the purchase of a new DE LAVAL. If you don't know a DE LAVAL agent, write to the nearest DE LAVAL office giving make, number and size of your present machine, and full information will be sent you.

Important to Users of Old DE LAVAL Separators

While DE LAVAL machines of ten or fifteen years ago are much superior even to present day machines of other makes, during the past four or five years many improvements have been incorporated in the present DE LAVAL machines that make them simpler in construction, easier of operation and more effective in skimming.

Liberal trade allowance will be made by any DE LAVAL agent on your old DE LAVAL toward the purchase of an up-to-date style. It will pay you to investigate. Any DE LAVAL agent will be glad to explain the new DE LAVAL improvements, or a DE LAVAL catalog illustrating and describing the construction of latest styles and sizes will be sent upon request to nearest DE LAVAL office.

FREE TRIP TO SEE THIS HAY PRESS AT WORK

LOS ANGELES AND RETURN AT OUR EXPENSE

WE PAY YOU TO INSPECT THESE HAY PRESSES.

Instead of paying a salesman's fare to show you a small model of a hay press, we will pay your fare to Los Angeles and return, not exceeding $15.00, to examine our California Special New Century, full circle, all steel, self feed Hay Press and all others on sale there. It makes no difference which hay press you buy, we pay your railroad fare just the same.

When you see for yourself how this machine has been built expressly for heavy baling on the coast, how strong it is, how easy it is on horses, what smooth bales it turns out, you will understand why we make such an offer. It has 7-in step-over, pull power, high baling chamber, positive plunger rebound; it stands up to its work, no taking off of wheels. Has record of 30 tons per day. We will ship you one to try. If you don't want it we will pay freight both ways. Write now.

CONTENTS THIS WEEK

SAN BERNARDINO ARROWHEAD.—Cover.

CITRUS AND TROPICAL FRUITS.—Blemishes of Citrus Fruits; 324, 325.

CITRUS GROWERS' CONVENTION, 323.

DECIDUOUS FRUITS.—Phosphate in Montana; Cancer in Plants; Fungicides and Insecticides; 326, 327.

GARDEN AND FIELD CROPS.—Spanish Onion Growing; 328.

HOME GROUNDS BEAUTIFUL.—Sanitation of the Farm Home; Beautifying Home Grounds; Gladiolus; 329.

NATIONAL ORANGE SHOW, 330.

LIVE STOCK AND DAIRY.—The Pigs; Hygiene of the Foot of the Horse; Dried Beef; Sand in the Stomach; 331, 332.

VETERINARY.—Sow Vomiting; Worms in Horse; Water Blister; 333.

EDITORIAL.—Convention Notes; Drones; Journal of Economic Botany; Effect of Stock on Bud; 334.

AGRICULTURAL NEWS NOTES OF THE PACIFIC COAST.—Northern, Central, Southern, The Coast; 335.

PRACTICAL POULTRY CULTURE.—Stray Ideas on Poultry; Improving the Quality of Eggs; Canker; Value of Poultry Manure; Egg Eating Hens; Pure Breeds are Best; Winter Layers; 336, 337, 338.

IRRIGATION AND FORESTRY.—Preparing Alfalfa Land for Irrigation; Suez Canal; 339.

QUESTIONS AND ANSWERS.—Worms Attacking Beans; Fencing Out Goats; Fertilizers About Trees; Planting Orange Seed; Weevil in Beans; Curl Leaf; Winter Raspberries; Sow Bugs; Dry Her Off; Grafting Wax; Sowing Eucalyptus Seed; Rose Scale; Topping Nursery Trees; Sprays; "Bats in the Belfry;" Red Spider on Peach Trees; Guinea Fowls; 340, 341.

ENTOMOLOGY AND BEES.—How I Produce a Crop of Extracted Honey; 343.

TIMELY RANCH SUGGESTIONS.—Seeding Spring Alfalfa; What to Do With Grasshoppers; Treatment of Grain for Smut; 344, 345.

HOUSEHOLD DEPARTMENT.—The Man with the Hoe; Pauline's Tiger; Useful Helps for Girls; Serving Oranges; 347, 348, 349.

PRODUCE MARKET.—Los Angeles Market; San Francisco Market; Citrus Market; 350, 351.

CONVENTION NOTES.

Mr. Shamel's work in the development of a better Washington Navel will be watched with greatest interest. For the impatient one there will be a long wait, for as Mr. Shamel said at the San Bernardino convention, it may be five years before any very definite information can be given out. A perusal of Mr. Shamel's article in the next issue will be interesting as showing the line he is following.

It is almost amusing to sit in a convention and hear scientific problems relating to fruit culture discussed. First, the difference of opinion, then the conclusion that we know little about it anyway, bring to one's mind the question, "Of what value are these discussions?" But with all the confusion, it must be admitted that the clearest understanding can only be secured by looking at all sides, and this helps one to get on the ground of toleration, to see that the other fellow has a right to his opinion.

One question at issue in the late convention was the matter of chlorosis, and after discussion of the lime-magnesia theory, the need of more humus, the need of deeper tillage, the need of deeper irrigation, and other needs without number, the general admission was made by nearly every speaker, "We don't know what causes chlorosis or yellowing of orange and lemon leaves."

Referring to the need of the very best scientific education for a successful grower, Mr. E. A. Chase of Riverside remarked that the grower should be like Davy Crockett with his long gun, when he went into the woods for coon, the coon always came down and delivered himself up at once—it was usel ss to evade his aim. Too often our growers go gunning with a blunderbuss.

It is perhaps timely to take up one point made in the discussions at the convention, "Don't plow deeply at blossoming time." Root disturbance by tillage at such time shocks the tree and induces less growth and fruit holding capacity.

One speaker in referring to the necessity for deep culture especially in the breaking up of plow sole, described an appliance that did the work effectively and suggested that two good horses—if they were mules—would handle it all right. When it comes to deep soil culture, it is almost necessary that our horses be mules, or at least tough enough to stand hard draft day in, day out. The farmer who goes at orchard work with a light team will be troubled with many things, among them, chlorosis.

Kenneth McRae spoke of having kept a careful tabulation of sales of citrus fruits in the Eastern markets last year. In those sales were 700 ranging in price from 50 cents to $1.40. The orange grower doesn't need a very long pencil to figure out that the principal return to him from such sales is red ink and plenty of it. Our growers are putting up some excellent fruit, those going under the "Sunkist" brand, for instance, being exceptionally fine. But with this good fruit are constantly going forward culls. The picking, the freight, the storage, nearly all expenses connected with the sale of culls are the same as for fancy fruit—it doesn't pay.

Humus benefits soil physically, chemically and biologically. It gives better drainage, better aeration greater moisture-holding capacity, keeps soil warm, improves its texture; chemically it furnishes nitrogen directly, makes available other soil elements; biologically it makes possible myriads of life which convert insoluble plant food into soluble. As our good friend Shaw would say, "With all your getting, get humus."

Another important point in handling green manure crops at this season was brought out by Dr. Lipman when he laid down the law that in light, sandy soils the cover crop should be plowed under as deeply as possible; in clay soils, as shallow as possible and still have sufficient dirt to cover. In sandy soils the air will reach down to the decaying crop no matter how deeply plowed in, a healthy condition obtains and the plant food is put where it is most valuable to the roots. But in heavy soils, if plowed under deeply, the air is not admitted and an acid condition of the soil is produced. When these points are considered, with numberless others having to do with green manure crop growing, it will be seen that there has been occasion for the many failures made. It requires intelligence and knowledge to grow green manure crops.

A look at the citrus industry with its great increase this year, with its average of a carload of fruit leaving the state every ten minutes, and bringing fair prices, assures us that there never will be any overproduction of good fruit. Perhaps we should put the word, "good" in full capitals so that we may not be called later on this statement.

Mr. Maskew's work as deputy state horticultural commissioner shows the need of watching ports of the southern part of the state as well as that of San Francisco. Into San Diego, where Mr. Maskew has been working, enter three regular lines of steamers and numberless smaller boats, and everyone of these vessels brings fruit which may be infested with some pest. The most dreaded of these is the fruit fly, one member of which family is the orange maggot. Mr. Maskew has succeeded in capturing some of these in the baggage of poor Mexicans coming up on the smaller steamers.

Mr. Maskew said that sometimes this work was almost heartbreaking; poor Mexicans with practically nothing have purchased small quantities of fruit to bring to their friends in this country a little offering from the native land; they understand no English, and it is almost impossible to convey to them any reasonable excuse for taking away their little property; some will stolidly stare, while many will plaintively explain that the fruit is not being brought in to be sold, but to give to their loved ones; they cannot be made to understand the fearful cost to the fruit industry of this state if they should bring in the dreaded fruit flies.

DRONES.

Mr. E. A. Chase, in speaking before the citrus convention on the subject of selecting buds for trees, referred to the fact that the orange orchards of the state are afflicted with from ten to 25 per cent of drones, trees standing in the orchards, cumbering the ground, costing for fertilizers, irrigation and general care, yet returning practically nothing to the grower. The dairyman refers to his unproductive cows as boarders. Call them what you will, boarders or drones should be closely observed and eradicated. They appear in every calling, perhaps to the greatest extent in agriculture. Mr. Chase made the point that it is sheer carelessness on the part of orchardists to allow drone trees to remain. In passing through the orchards he sees these non-productive trees and consoles himself with the assurance that next year will be their full year, while some other trees will be taking their rest, but he fails to mark these particular trees, and the following year, when they again show their light crops he passes them on in the same way, hoping that another year they will give full crops.

The careful work being undertaken in the orchards of the Chases is showing that these drones are chronic cases, and the tree which bears a full crop one year is almost sure to bear a full crop the next. This statement will be combated at once by those who, thinking they have observed closely, have "seen" otherwise. Careful record of each tree will bring money to the orchardist just as the Babcock test has brought money to the dairyman. Keen competition is bound to relegate poor fruit to the cull pile, and the trees which produce light crops almost invariably produce culls, and those that produce culls one year will produce culls the next. The sooner the orchardist makes careful observations and rebuds his trees, the sooner his grove will yield a competence.

JOURNAL OF ECONOMIC BOTANY.

The Pomona College located at Claremont has for the past few years been issuing a valuable publication in the Journal of Entomology which has been largely quoted in scientific publications. Beginning with the first of February another valuable publication in the Pomona College Journal of Economic Botany as applied to sub-tropical horticulture, is to be issued quarterly. It is to be of a less technical nature than the Journal of Entomology. The first issue contains: Avocado in Southern California, Withertip in Ventura County, Biological Expedition to Southern Mexico, and The Botanical Garden of Para. It is well printed and beautifully illustrated, this first issue containing 72 pages. Professor C. F. Baker of Pomona College is the editor.

EFFECT OF STOCK ON BUD.

The effect of the stock on the bud or the fruit of the bud, as discussed in recent Cultivators, was taken up and discussed quite fully at the convention. Like those who expressed opinions in the Cultivator, the speakers were not positive as to influence exerted. The veteran nurseryman, Mr. E. A. Chase, said that he did know there were certain influences both of stock on bud and of bud on stock and root. For example, he referred to the Siberian Crab bud or graft being known to have a material influence on the root, causing much different growth from that of a Baldwin on the same root. The question was asked as to whether anyone had observed similar effect of bud on sour or sweet root. One speaker maintained that he had seen material influence of root on bud, and of course all admitted the ill effects of the China lemon root.

Imperial Valley settlers and others in sections where agricultural conditions are similar should write to the Experiment Station at Berkeley for copy of Bulletin 210. It is entitled "Imperial Valley Settlers Crop Manual," and is edited by Dr. J. Eliot Coit and Walter E. Packard.

Agricultural News Notes of the Pacific Coast

Northern California

Tobacco was successfully grown at Palermo.

Almond growers of the Sacramento Valley found greater profit in the sale of shelled almonds.

Boca, Nevada county, is harvesting ice at the rate of 10,000 tons daily. It is two feet thick.

The big hatcheries of Petaluma are now able to get abundance of eggs at the lowest prices of the season.

The Sutter-Butte Canal Company, capitalized at $1,250,000, has filed articles in Oroville, Butte county.

Healdsburg, Sonoma county, is advocating the holding of a harvest festival and water carnival the coming fall.

A million dollar dam will be constructed in the Carson river which will enable the irrigation of 11,000 acres.

A filing on 50,000 inches in the Consummes river has been made. It will supply water for the Volcano reservoir project.

Amendments have been made to the Torrens Land Act passed some years ago which will make, it is hoped, a more practical law.

The California Fruit Canners' Association has purchased 750 tons of blackberries from the Sonoma County Berry Association.

Large numbers of orange and olive trees have been set at Palermo, Butte county, one nurseryman having set over 75,000 trees.

The country life commission of the state met at the University Farm last Saturday and laid plans for a state conference of farmers and educators.

The Sebastopol Apple Growers Association elected J. W. Turner, president; E. E. Murford, vice president; E. C. Merritt, secretary, and C. E. Hotle, manager.

Steps are being taken for the construction of a big reservoir and the perfecting of an irrigation system which will greatly increase value of lands in Big Valley, Lake county.

The Hayward Poultry Producers Association was addressed at its regular monthly meeting last Saturday by Prof. C. M. Haring of the state university on the diseases of poultry.

Colorado capitalists have filed on 250,000 inches of water from Turtle Bay in the Sacramento river near Redding. The waters will be used for irrigating lands in Shasta and Tehama counties.

"West Sacramento Reclamation District No. 800" which will be made possible by a bill passed by the legislature and signed by the governor, will reclaim a vast body of land near the city of Sacramento.

The fight of the farmers near Anderson, Shasta county, is claimed to be practically won over the smelter men who have installed smoke arresters which are proving successful, but at the same time very expensive for the smelter people.

Owing to the unfavorable season troubles have arisen between the Sonoma County Co-operative Poultry Association and the Sonoma County Fruit and Produce Company which have made it necessary to abrogate the contract for egg marketing.

Central California

The Kerman Creamery will open a branch at Los Banos.

Turlock growers are buying melon seed and getting ready for a big season.

The state's raisin output was about 65,900 tons, of which 7,500 tons were exported.

Raisin packing has been resumed at the packing house at Armona, Kings county.

Exeter, Tulare county, decided to incorporate last week by almost a unanimous vote.

Porterville Chamber of Commerce plans for a big exhibit at the Los Angeles Land Show.

Burning of sulphur under prune trees has been recommended as a means of destroying thrips.

Last season's fig crop of the San Joaquin valley has been practically all closed out at 3½ cents.

The Turlock Irrigation District received during 1910 $386,242.30 and the disbursements were $281,900.74.

Watsonville is about to have a new fruit magazine devoted principally to apple conditions of the Pajaro Valley.

One rancher at Corcoran sank an artesian well to the depth of 1721 feet and secured a flow of 88 miner's inches.

It is feared that the driving rains of the recent storms may have injured the blossoms of early peaches and of plums.

The annual convention of the California Association of Mutual Fire Insurance Companies was held last week in Tulare.

Fresno county produces 8,000,000 gallons of sweet wines, 2,000,000 gallons of dry wines, and 1,500,000 gallons of brandy.

Ducor, Fresno county, had a carload of ornamental trees quarantined by Commissioner Schulz because of scale insects infesting them.

San Jose has a committee at work perfecting the organization of the Santa Clara County Fair and Live Stock Exhibition Association.

The continued rains have insured the hay crop for the coming season and, more, have knocked the bottom from the market for holdover hay.

Much farming land has been seriously injured by the washing away of soil by floods. On the whole the advantage is far greater than the loss.

The Santa Cruz County Egg Exchange opened for business on Saturday the 4th. Poultrymen all over the county are taking great interest in this organization.

At the last meeting of the San Jose Grange the lady members had charge of the program and discussed the part women have had in the larger agriculture of the world.

Many of those who had worked for the county fair bill are disappointed in the district bill which finally has been substituted for it, and feel that the bill should be killed.

The law making bonds of irrigation districts legal investments for banks, trust and insurance companies is pleasing to the members of the Turlock and Modesto irrigation districts.

Southern California

An alfalfa meal mill is in contemplation for Arlington, Riverside county.

The next two months will see California's greatest orange shipping period.

Many apples and apricots are being planted in the Banning, San Bernardino county, section.

The last storm gave a precipitation of from five to seven inches in different parts of California.

The new pipe line of the Fillmore Irrigating Company was badly damaged by the recent storm.

The Alamo Canal, supplying water to a portion of the Imperial Valley, is being improved by raising its levees.

Some cantaloupes have already been sold in the markets of Los Angeles, but they were imported from Mexico.

C. R. Mann, a specialist of the United States Department of Agriculture, is investigating citrus decay in Southern California.

The Santa Ana river broke from its banks and did much damage in Orange county, but it is now receding and is under control.

Landscape artists are busy with the laying out of grounds and planting of trees for the Panama-California Exposition at San Diego.

Lakeside, San Diego county, has just introduced a number of registered Holstein cattle to help build up the dairy stock of that section.

Many acres of valuable farming lands in Santa Barbara county were destroyed by recent floods in the Santa Inez river. The loss aggregates over $100,000.

The demonstration train through the orange belt and the Imperial Valley last week drew out the usual big crowds though the storm interfered in some sections.

The 1911 sugar beet crop of Orange county is declared to be by all odds the biggest the county has ever raised. Four big factories will be in operation in that county.

The National Orange Show at San Bernardino last week had strong competition in the stormy weather, but its success was such that another fair is already being planned.

High water and the breaking of levees along the lower Colorado have caused some apprehension on the part of Imperial Valley people of the possible flooding of the Salton Sea.

The conference between the water users of Riverside and San Bernardino counties was recently held to determine between pumping and riparian rights along the Santa Ana river.

The new board of directors of the Anaheim Sugar Company is composed of C. M. Warner, A. R. Peck, E. T. Stimson, I. S. Richards, C. O. Rust, Wm. McLauchlin, Richard Melrose.

At a recent annual meeting of the directors of the San Diego County Fair Association at Escondido the number of the board was increased to seven as follows: H. F. Lockett, Frank G. Thompson, Maurice Reidy and R. L. Huffman of Escondido; Joseph Richert, Pacific Beach, Joseph Foster, Fosters; W. B. Hage, San Diego.

The Coast

Baker county, Oregon, will ship 60,000 head of sheep.

Prime steers are selling in Portland at $6.75 per hundred.

There are still 41,000,000 acres of lands open to entry in Arizona.

Orchards in the Coeur d'Alene section promise an excellent apple crop.

One acre of celery at Hood River, Oregon, produced over $1,600 last season.

Snowfall at Spokane in the storm of the last of February was the heaviest recorded.

The Short Course work in Horticulture is now on in the state college at Pullman, Washington.

The horse fair association of Mount Angel, Oregon, will hold its third annual on Saturday, April 1st.

Farmers of Washington county, Washington, are perfecting an organization for the support of the parcels post movement.

The directors of the Fat Stock Show Association of Lewiston, Idaho, are planning for a great showing of fat stock the coming fall.

Stock growers of Baker county, Oregon, are happy in the fact that the county has paid bounty on 2,390 coyotes and on 111 bobcats.

Fruit growers at Elgin, Oregon, have organized for the coming year's work by the election of the former officers of the shipping association.

Prof. Forbes of the University of Arizona estimates that there is in that territory water sufficient for the irrigation of over a million acres of excellent land.

Members of the State Fair Association of Oregon are in arms because of the governor vetoing a bill authorizing the appropriation of $50,000 for buildings.

Experts of the geological survey and department of agriculture are making strenuous efforts to discover potash deposits in various sections of the arid West.

The president of the Washington Dairy Association insists that the laws of that state should be changed, maintaining that the dairy industry is discriminated against.

The attempt of an orchard company at North Yakima, Washington, to get control of water rights from Ahtanum creek is being fought by riparian owners along the stream.

Agents of the government are suing the Colorado Fuel and Iron Company for return of 5800 acres of coal land in Las Animas county, Colorado. It is valued at $3,000,000.

Apple growers at North Yakima, Washington, have fixed upon two grades for all apples shipped from that section and have established the brands as fancy and extra fancy.

The Northwestern Fruit Exchange with offices at Portland has conducted its first year's business most profitably for its members. It sold during the season something over 800 cars.

The burning of forest sections of Idaho and Eastern Washington last summer will give an impetus to the lumber industry for the coming year in that the burned timber will be worked into lumber at once.

Practical Poultry Culture

STRAY IDEAS ON POULTRY.

I have found the following a better plan for a hen house than having an open front, as has been so widely advocated.

Build the roosting platform along the back about three feet above the floor. Leave it open below the platform and make all the rest of the house tight. Put as much glass as possible in the south wall. Build a scratching shed on the north, with tight north side and ends boarded down even with the eaves. Enclose the opening of both ends with one-inch mesh poultry netting to keep out vermin. I have a netting at one end fastened to a frame and hinged, making it convenient to enter with feed and litter. I have self-feeders in this shed, and leave grain scattered in the litter, so the chickens can get down and hunt their breakfast as early as they want to without the necessity of the caretaker going out so early, and yet they are safely shut in. The door may be in the south and be left open pleasant days to thoroughly air the place. In a house of this kind there is always fresh air without the possibility of a direct draft on the fowls when they are on the roost. Nor can the rain ever blow into the house proper.

To make a light, portable roost, take a piece of quarter-round about two inches thick and four feet long. Bore an inch hole near each end of each flat side. Do not place the holes exactly opposite nor bore quite through. Insert four legs 30 inches long. Drive an eight-penny nail about half way into the upper side of each leg 12 inches from the lower end to support two more quarter-rounds. Such a roost will accommodate 20 or 25 fowls, and is easily moved when taking up the droppings, or quickly taken apart to be disinfected. A V-shaped trough made of ten-inch boards is convenient to lay the separate pieces in where boiling water may be poured over them.

Although I have used a fireless brooder with success I had trouble at first getting the chicks to go back in after eating. I found that by having a box the width of the brooder and three feet long for them to eat in the first few days, it was an easy matter to remove the cover of the brooder, and cover the feeding box so as to make the latter dark. The little chicks quickly go into the brooder where it is light. In this way they soon learn to go back and forth at will. A slot in the side of the box, one inch above the bottom, two inches wide and six inches long, and with a shelf in it, makes a convenient place to put a pie tin of milk or water for the chickens.

A teaspoonful of salsoda in a quart of hot water is good to wash the drinking vessels with every day.

In the summer time, if one has more skim milk than the fowls will drink readily, it is no trouble to let it sour, and make cheese of it. If it is heated and stirred, then left till cold, the curd will settle and the whey may be poured off without the use of a cheese bag. If, in cold weather, when it does not sour easily, the milk be warmed to about 86 degrees, and just enough rennet be added to make a soft curd, in about 20 minutes it can be stirred, the whey poured off and it is soon ready for the chickens. They like it as well as the sour cheese. Cornmeal can be mixed with both kinds to balance the ration.—Portland Oregonian.

IMPROVING THE QUALITY OF EGGS.

An active campaign for the improvement of farm eggs in the Middle West was undertaken last summer by the bureau of animal industry of the United States department of agriculture. This work was preceded by a general survey of the field in the spring of 1908, which showed that an enormous loss was being sustained annually as the result of spoiled and deteriorated eggs. This loss results from the ignorance, carelessness or indifference of the farmer and from the dilatory and unsatisfactory methods of marketing in vogue. The actual money loss is suffered mainly by the farmer, while the loss in quality is borne by the consumer.

The campaign of the last summer had for its ultimate end the improvement of conditions surrounding the handling and marketing of eggs, and consequently the improvement of the quality of the egg itself as it reaches the consumer. Coincident with such improvement there will be a saving to the farmer of a great part of the money loss at present sustained.

The efforts have so far been directed mainly to education in better methods, co-operation with egg buyers and state authorities, and experimentation. Incidentally they have given the farmers help whenever possible in the practical management and breeding of poultry, and have urged the keeping of purebred poultry.

CANKER.

Canker in the throat may be caused by eating unwholesome or sour food. Such food will make canker sores in the mouths of chickens, as it will in the mouths of children and people. But there is another kind of canker that is very much worse; this is diphtheritic in character. It grows in patches, on top of the tongue, under the tongue, and on the sides of the throat, and gives off an offensive odor. This is dangerous, and spreads rapidly through a flock. It is usually caused by fowls being compelled to live or roost in a filthy place; damp floors, damp interiors, filthy material, etc., will bring on this disease.

If it is of simple character, the throat can be swabbed or washed out with a solution composed of three parts of warm water and one part of vinegar. Another solution is one ounce of chloride of potash in seven ounces of water. Five per cent of carbolic acid can be used in very bad cases. However, this is apt to burn or blister. Make a paddle of soft wood, small enough to insert in the mouth. Gently scrape and clean off all appearance of canker; do this without causing the blood to flow. After the canker is removed, wash the interior of the mouth with one of the solutions before mentioned. After washing, dry thoroughly and apply powdered burnt alum. This is made by placing a piece of crystal alum on a pan or shovel and setting it on a hot stove until the alum dries into a coarse powder; this can be mashed up very fine and sprinkled on the sore

places, or the sore placed touched or moistened with a few drops of peroxide of hydrogen.

If the canker is very bad and of a diphtheritic nature, it is better to kill all the fowls afflicted with it and burn their bodies. Clean up the premises thoroughly, disinfect with a solution of kerosene oil four parts, crude carbolic acid one part. This should be used as a spray. After the interior of the building has been thoroughly cleaned, spray this preparation into the cracks and crevices; paint the roosts with it and sprinkle or spray the inside of the nest boxes. Burn all the straw and other material of every kind that is in the building. Clean the floors and put clean, dry straw over them. Use Conkey's roup cure in the drinking water. Pour a tablespoonful of kerosene oil on top of the drinking water in which the roup cure is mixed.

If there are no muslin curtains in your poultry houses, take out a sash or two, put a muslin-covered frame in their places. All such diseases are avoided by perfect sanitation, dry floors, and fresh air.—Country Gentleman.

It has been calculated that a small, active fowl of between three and four pounds live weight, will consume between three and four ounces of food per day, and if the poultry-keeper has it all to find for her, a stone of food will last her 63 days, or 9 weeks, and if the cost per stone be 10d. or 11d., she will not be fed for less than a fraction over one penny per week, about 1¼d. if she be four pounds in weight. Should she weigh five and a half pounds, a calculation has been made that she would not be fed with less than four and a half ounces per diem. A stone would then last her seven weeks, bringing the cost to about three-halfpence per week. If she attained the weight of from 7 to 8 pounds live weight, she is supposed to be able to consume five and one-third ounces, which would make a stone last her exactly six weeks, and at top prices of a shilling a stone, the cost would be twopence per week. A big fowl will usually cost twopence a week, even if food is down in price a little. Something goes in waste, rats, mice, birds, etc.—Poultry Yard.

VALUE OF POULTRY MANURE.

Of all the manures, hen manure is the most valuable. It has twice the value of either cow or horse manure. This is due largely to the fact that it contains so much less moisture. Hen manure is especially rich in nitrogen, the element which the corn crop requires above all others. The nitrogen in hen manure is in a very readily available form. Hen manure is known as a hot manure, and should never be placed in contact with growing plants. It will not hurt the soil, however, in the slightest. We would not advise plowing hen manure under very deep. In fact, we would prefer shallow plowing or else harrowing it in on plowed ground. We do not know whether a manure spreader would spread hen manure successfully, but rather think it would not. It might be a good plan to mix the hen manure with cow or horse manure and apply them together with a manure spreader; or, the hen manure might be applied from the ordinary wagon by shovels.—Wallace's Farmer.

When a hen doesn't respond to good feeding and good care, it is a pretty good sign that she isn't "cut out" for profit in the poultry yard.

EGG-EATING HENS.

How many of our readers ever had trouble with hens eating their eggs? It certainly is a provoking habit with which the poultry raiser has to contend. During the summer time, when the hens are on the range and can supply themselves with the necessary variety of food, there is seldom any trouble with hens eating their eggs. It is in winter, when the fowls are closely shut up, perhaps with twice as many as the quarters ought to house, that idleness and a one-sided system of feeding will cause the habit to be learned.

Sometimes the habit is learned by the breaking of a fresh-laid egg on the house floor, but usually the hens crave a kind of food they do not get, and sitting around idly all day in the vicinity of the laying apartments, their curiosity and craving for food leads them to peck at everything in sight. When once the egg-shell is broken the whole flock rush to devour the contents.

To break the habit, feed the hens a proper amount of animal food—a meat ration. Beef-scrap is good. Green cut bone is excellent. Clover hay also supplies a variety of food elements which the hen needs. "Idleness is the mother of vice" applies as much to poultry as to anything else. It applies to the manager of the poultry as well as to the hens themselves. Then the best preventive measure for egg-eating is to supply the hens with the kind of food their bodies need and to keep them busy all the time. A laying hen should be as busy as a bee. She is usually busy in the summer time searching for insects, bugs, etc., shuffling in the cool dust under a dense bush, and searching for a secluded spot in which to deposit her egg. These conditions should be supplied as nearly as can be in the winter months.

Dark and secluded nests should always be provided. They should be raised above the level of the floor. The hen that wants to lay will delight to search for the place that suits her. The hens that do not lay will not bother a dark nest. Have the nests well filled with clean straw, so that the egg will not be broken when it is dropped.

Sometimes the habit of egg-eating becomes so firmly fixed on some hens that it is impossible to break them. They will forget to follow their practice during the summer time, but as soon as they are shut up at the approach of winter the habit recurs. A bad feature also is that these hens teach others the habit, and the whole flock practically are egg-eaters. The poultryman wonders why he gets so few eggs. The only way to kill the habit is to kill the hens that are the leaders. Such hens are sly and cunning and it will require a great deal of watching and deception to catch them in the act. These hens usually are not laying themselves, but watch the nests, and as soon as an egg is laid and an opportunity is offered they follow up their pernicious habit. No matter how valuable such hens are, send them to the butcher. Eating your eggs eats up the profit. Eggs are too expensive a food in winter to feed to grown-up hens.—Wisconsin Agriculturist.

The dust bath is one of the most necessary things that go to make up a fowl's life to rid it of lice. If the hens get the dust bath outdoors in the summer and it is good for them, then we must provide it indoors.—Denver Field and Farm.

Made to Meet Coast Conditions

CYPHERS Incubators and Brooders *are by far the best* for use on the Pacific Coast.

Ten years' experience *has proved this!* We have letters from leading, successful poultrymen from one end of the Coast to the other. They all tell the same story of *continuous, high percentage hatches.* Many of these letters, all of them of *late date*, are published in our new 1911 Year Book. It's a big 212-page *guide to poultry profits.* Helpful, practical, inspiring! And it tells all about

Other Foods May Come and Go, But

COULSON'S FOOD

Remains The STANDARD

The Passing Show

NOTE

If you have never used our food you owe it to your flock to give it a trial. If you have become discouraged through using an inferior brand, take heart and get a sack of

COULSON'S FOOD

When you find an article that remains on the market year after year—the same yesterday, today and tomorrow—you can always count that it possesses true value. The law of nature works only one way, and that way is toward perfection. It is the survival of the fittest—the perishing of the inferior.

We have watched with interest the arrival and departure of poultry foods. We have seen dozens of brands ushered in with loud trumpetings and then ushered out again. They have played their parts and the poultry world is through with them.

We have maintained a standard in our foods which has never been attained by any other manufacturer. We have given to the poultry industry the result of years of experience and study and today our foods stand supreme on the coast.

We Manufacture a COMPLETE LINE

You can obtain our goods from any reliable dealer. If you will insist on getting Coulson's Food, you will secure the best on the market at no additional cost.

THE WINTER LAYERS.

There are at least four things to consider about the question of winter production of eggs—the birds, the feeds, the places of shelter and the peculiarities of the weather.

The birds should be of what are known as the egg breeds, or at least be offspring of a flock of hens which are good layers. It is all the better if these parent hens are good winter layers. There may be nothing in the claim that there is an egg type of birds, but it is certainly true that the bird that looks like a good layer will usually lay more eggs in winter than the one that is of inferior appearance. Culls never make good winter layers, and if the bird looks like a cull she should be rejected. They should be matured at least by the first of November. For this purpose it is best to select the winter flock from those females which were hatched the latter part of March or in April.

As soon as possible the flock selected should be separated from the other birds and fed a ration which will encourage the development of eggs. The ration should be similar to that given the birds which are producing eggs. Feeds rich in protein should make up a large part of the ration. Lime and charcoal should be fed liberally.

The quarters should be considered, especially the place where the birds are to roost during the winter. One of the reasons the birds produce more eggs in the spring than in the winter is because the climatic conditions are more favorable. If eggs are to be received during the winter the quarters must be such that they will modify the extreme climate till it conforms nearly to that in the spring. This should not be interpreted to mean that the houses should be made air-tight, for the birds need plenty of fresh air. Fresh air is one of the principal essentials in the production of eggs in the spring. The house should be well ventilated and perfectly clean, but at the same time it should be warm and comfortable.

It is up-hill business to promote the production of eggs in the winter when the weather is damp and very changeable. Buildings can be constructed to modify the weather, raising the temperature many degrees, but to maintain a uniformity it is necessary that the weather be uniform in and outside the building. If the house is built to raise zero weather to the proper warmth in the interior, it will be too warm when the temperature takes a sudden rise of twenty to thirty degrees. As nearly as possible the would-be keeper of winter-laying hens should provide quarters which will admit of great variation of temperature on the outside; yet if he fails because of changeable weather he should not be discouraged.

PURE BREEDS ARE BEST.

Occasionally one comes across a farmer who believes that common scrub fowls are hardier and more profitable than the pure breeds, but the number is getting less every year.

It costs no more, after the first purchase, to keep a flock of improved fowls than it does to harbor dunghills or cross breeds. Either kind, when properly fed, will eat just about as much as the other. Or if there be any saving, it is so trifling as between one or the other kind that it is not worth noticing. If judiciously provided for and tended from the shell upward, as all fowls should be cared for, either of the larger breeds will make good eating poultry at the proper age, and the hens of any one kind will lay an abundance of eggs, take them as they average, throughout the year.—Kansas Farmer.

Irrigation and Forestry

PREPARING ALFALFA LAND FOR IRRIGATION.

By J. H. Squires, Agronomist, New Mexico Col. of Agri.

More crop failures on the irrigated lands may be traced to faulty leveling than to any other cause under the control of the farmer. Poorly leveled lands are expensive to irrigate, both with regard to the amount of water and the amount of labor required; and in addition, the plants in the different parts of the field are so unequally watered that unsatisfactory crops are the result. The machinery necessary for leveling on the small farm is simple and inexpensive, and should be kept in order that all spare time of men and teams can be used to the best advantage. On the small farm all that is necessary is a small Fresno scraper, a plow, and a plank drag.

In leveling, the first thing to do is to decide just how the land can be put into shape by moving the least amount of dirt. A good way to begin is to set stakes to represent borders, and see how they may be located in order to obtain the best results. It is not necessary that an entire field should be level, but only that the soil within a border be so; and each border may drop lower or rise higher than the one adjoining, without any serious inconvenience in either seeding or harvesting. Borders should not be spaced too wide. Forty-five to sixty feet will be a good width if the field is at all sloping; and it is not best to make them more than 100 feet apart, even when the land is level. Locate each border definitely, and mark it by throwing up a couple of furrows, or in any other way that is convenient. Then beginning the high end of the field, work out the first border, taking all excess dirt from the high places and spreading it where needed in the low places. In sandy soils the borders should not be more than 200 or 300 feet in length, but on clay soils no limit need be set for the length.

For the location of the borders, especially if they are long, it is almost necessary that a level be used. These may be purchased for about $18 to $20. Permanent borders should be built at the time of leveling. These should be just high enough to control the movement of water, and should be wide enough to prevent any danger of their being dragged down by machinery or washed down by the running water. A convenient and very satisfactory way to build such borders is to drag up the dirt with a scraper and deposit it along the lines of the border; where it should be smoothed into the desired shape. If the borders are built with a broad base and slowly sloping sides, crops can be grown along the sides and top without any difficulty. The base of such borders should not be less than eight to ten feet wide.

After all borders and the checks or cross borders, are complete, it is best to go over each section of the field and true up all slight inequalities that may have been missed in the first leveling. Here again the level is of great value, as it points out these errors much more closely than the best trained eye. If there is free and abundant supply of water, and the field will not need it for some time, it is well to give it a trial irrigation; making note of all the points that are either low or high, and correcting these as soon as the soil is dry.

One thing that must be borne in mind is that where any large amount of earth is hauled into a low place, the level of the land will be destroyed by this soil settling after the first few irrigations, unless allowance is made for this and a slight excess of soil is moved in. This is hard to estimate, and for this reason it is well that the field be not seeded to a permanent crop, like alfalfa, the first year after any decided leveling. The small grains are perhaps the best crops to try on newly leveled fields. They do not occupy the soil for a great length of time, and can stand an excess of water in any place that happens to be low, perhaps, better than a majority of the crops grown in this region. Then, too, the surface is left in an excellent condition for correcting slight inequalities in level that may yet remain. When these corrections are made, the soil should be ready to put in alfalfa or any other crop that will be on the land for years, with no fear of drowning out the lower levels. Great advantage in operation results from the use of well-built boxes and gates for the turn-outs and other control of water.

THE SUEZ CANAL.

Owing to interest in the Panama canal at this time, the following answer in an eastern paper to an inquirer as to the Suez Canal may be of interest:

"The present Suez canal was devised by M. Ferdinand de Lesseps, who in 1854 was granted by Said Pasha the exclusive right to construct such work. He organized a company for its construction in 1858, and was guaranteed the exclusive right of way for a period of ninety-nine years. It is an interesting fact that the present canal follows very nearly the course pursued by a canal that was constructed some thirteen years before the Christian era by Rameses II., or his father Sethos, commonly known as the Pharaohs. The length of the canal is about one hundred miles, of which seventy-five is actual canal, the remainder passing through lakes that in places require dredging in order to secure sufficient depth. The width at the surface is from sixty-five to one hundred and twenty yards, and at the bottom about twenty-four yards. The level of the two seas being about the same, no locks are required. Before the waters were united it was generally believed that the surface of the Red Sea was at a slightly higher elevation than that of the Mediterannean, although scientific tests proved that it was not so. The canal cost about $95,000,000, of which sum the shareholders furnished $64,000,000 and the Khedive of Egypt the remainder. Work upon the excavations was begun April 25, 1858. The canal was completed and opened November 16, 1869. The greatest depth of excavation was about 85 feet. The canal is open to vessels of all nations on equal terms. The dues are about $2.60 per ton, $2 for each passenger and pilotage fees. The canal is now the property of the French and English, the 177 shares in the stock formerly owned by the Khedive having been purchased by the British government for $20,000,000. The French company still controls the remainder of the stock, 223 shares."

Standard Among Drilling Machines

Questions and Answers

THE EDITOR AND STAFF

Questions to be answered in this department should be received at this office one week before reply is expected. Write plainly on one side of the paper and sign full name and address. Unsigned communications receive no attention.

Worms Attacking Beans.

I have five acres of Henderson's Bush Limas. Had an extremely heavy crop but a little white worm ate the greater portion, getting in its work while the beans were green. How can I prevent this another year? —Subscriber, Beeville, Texas.

This inquiry was referred to County Horticultural Commissioner E. O. Essig, of Ventura county, and he writes:

"In this district surrounding Santa Paula we have a similar condition as was referred to by your Texas subscriber. The worm is a small pink larva of a moth and bores into the pods and destroys the beans before they have an opportunity to ripen. The insect referred to in Texas is more likely the cotton boll worm, heliothis armiger, which also attacks the Bush Limas in the same manner, and which is common in Texas. Anyway, the methods of handling the insect would be practically the same, and as follows: By crop rotation and using "catch plants." In this county the Bush Lima is the only bean attacked, so the common Field Runner Lima would make a good rotation crop. Other crops may also be used to a great advantage in this way. The cotton boll worm is commonly handled by planting catch plants among the crops attacked which are preferred by the worms. Sweet corn is used for this purpose. The corn is planted in time to insure the formation of the ears before the pods of the beans are set. The moths in depositing their eggs favor the corn rather than the beans and by scattering the catch plants throughout the field much good may be accomplished in this way. In case the insect is the one referred to above it will be impossible to exterminate it unless the cotton fields and other hosts are kept free from it in the state. Your state entomologists at College Station, Texas, can give you the desired information regarding this pest in your own state.

Fencing Out Goats.

My neighbor has a bunch of goats that are in my orchard nearly every day. Am I compelled to build a fence in order to collect damages?—Subscriber.

Under the law in force for the last four years it is necessary for you to build a "substantial fence" in order to be able to collect any damages from trespassing stock. However, we assume this law will be wiped off the slate and the stock owner will have to keep his stock within bounds. At present you have only the estray law to act under and this stock may all be taken up and put in the pound or kept in your own barn at the expense of the owner. This may be done as often as the trespass occurs.

Fertilizers About Trees.

Is not too much horse manure buried around fruit trees and flowering shrubs injurious? Is a mixture of certain portions of several kinds not better, and how often and what time of year must it be applied?—Subscriber, San Diego.

Certainly, too much fertilizer is injurious, and one should be especially careful in not placing fresh, unrotted stable manure too close to stem or roots. A pile of freshly made stable manure thrown against the trunk of the tree may heat and destroy the bark, but if spread away from the tree and not worked in too close to the young roots, no great harm can be done. Above all, do not put stable manure in the fall around the root of young trees being planted. Some prefer to apply horse and cow manure mixed; others will apply these, and later, at time of cultivation, apply complete fertilizer. As the inquirer does not mention the kinds of plants or nature of soil, it is impossible to more than generalize.

Planting Orange Seed.

What is the proper time to plant seed for sour stock? What varieties of seed produce best sour stock for Washington Navel buds (or sweet stock)? What is the proper way to arrange seed in beds? How much space will a gallon of seed properly cover? Is it better to soak seed before planting? If so, how long?—Subscriber, Mesa, Arizona.

We refer our subscriber to article by Mr. Teague on citrus page of Cultivator of March 2nd, which gives full particulars regarding time and method of planting. Whether any seed is better than the sour depends somewhat upon the soil. If it is a fine, light, warm, sandy loam, either sweet or pomelo seed would probably be equal to the sour, but in heavy soil, where there is probability of continuous moisture at the roots, the sour stock has many advantages. Orange seed requires from 5,000 to 8,000 seed to the gallon, and 1,000 square feet will require about six gallons of seed. If the seed is kept moist from the time it is taken from the fruit until planted, soaking will add nothing.

Weevil in Beans.

How can I treat dried beans to keep weevil out? Wish them for eating.—Subscriber, Harper.

The only way to be sure of keeping weevil from beans is to put in cans or tight receptacle so the weevil cannot reach them. To destroy weevil now burrowing in beans, place in tight bin or receptacle, and on top of beans set dish containing carbon bisulphide. (One pound is sufficient for 100 bushels of beans.) If receptacle can be kept tightly closed for two or three days, so much the better. No light or heat must be brought near, as carbon bisulphide is very explosive.

Curl Leaf.

How often should peaches be sprayed for curl leaf? Hove sprayed once, but it has rained since.—Subscriber, Harper.

One spraying is usually sufficient, but if washed off soon after, another would add to the security. The later spraying is done before blossoming time, the better.

Winter Raspberries.

I note in the news columns of a former Cultivator that a Chico berry grower was marketing largely of winter raspberries. What variety of berry is this and where may plants be had?—Subscriber.

This is doubtless a case of treatment rather than of variety. The question was, however, referred to one of the best berry growers in the country and he writes:

"I have had no experience in growing winter raspberries, but several years ago a grower at Orange was sending raspberries to Los Angeles in considerable quantity in October and November and I was interested enough to make a trip to this man's place to

ascertain how it was done. I found him at home, but he had nothing to communicate on the subject of growing winter raspberries. Said it was a secret that he proposed to keep. He grew only the Cuthbert variety and on the way out of his grounds I interviewed a boy I found at work and learned it was their practice to cut off all blossoms in the early part of the season. I was there in the latter part of April and I noticed as the first observation when I entered the grounds that there was no sign of blossoms or fruit, and formed the opinion that it was simply a matter of treatment. That by preventing fruiting in the usual season they would easily come into fruiting at a later day, and after the talk with the boy, I felt positive my opinion was correct."

Sow Bugs.

Please give some means of destroying "pill" or sow bugs. They are hard on the back and roll up into a little ball when disturbed. They are destructive in gardens, and especially in adobe soil. Have tried different insect powders, but find tobacoc tea the most effective.—A. V. C., San Luis Obispo.

Sow bugs are usually found about soaked wood, but the sow bug cannot roll itself into a "ball," though it does curl up when disturbed. They are not usually found in sufficient numbers to cause any great damage, though in a very wet season they reproduce rapidly. We presume tobacco dust would be the best thing to use. It is impossible to reach them by poison.

Dry Her Off.

I have a Holstein-Jersey four years old giving milk for over a year. She will be fresh late in April. Am feeding middlings and other rich feed, and she is in alfalfa. Is now giving about six pints, but we cannot make butter of cream. As soon as churning is begun the cream foams up and will not make butter.—Subscriber, Lincoln.

Dry her off at once, as the small amount of milk she is giving indicates that she should be dry now.—M. E. S.

Grafting Wax.

Please give formula for grafting wax.—Subscriber.

On first page of Cultivator of February 16 will be found detailed directions by Mr. Roeding for making grafting wax; also in query columns of same issue is another formula.

Sowing Eucalyptus Seed.

What is the best time to sow eucalyptus seed?—Subscriber.

Blue gum seed should be planted in August or early September. This brings plants to the right size for setting out the following spring. The slower growing varieties may be planted somewhat earlier, as they do not reach a size that makes them difficult to handle by the next planting season.

Rose Scale.

What is best to kill scale on roses and when should it be applied?—B., Pasadena.

Kerosene emulsion is effective. Formula for making and using is given in full in Cultivator of November 3rd.

Topping Nursery Trees.

In setting out young trees or shrubs should they be topped?—Subscriber, Wyandotte.

The tops of plants which are being set out must be reduced to offset reduction in the root systems. It is impossible to take up any plant without destroying some of the finer roots, and as ordinarily taken up in nursery many are sacrificed. Besides, it is often better to severely top the tree. The usual proceeding is to make a clean cut of the ends of roots which have been bruised in taking up, then after planting, tamping dirt and irrigating, the top is cut to the desired height. For example, if it is a prune orchard, some orchardists prefer to top every tree to sixteen inches from the ground; others slightly higher. In shrubs it would depend upon the variety.

Sprays.

What is the best formula (spray) for exterminating insects, scale, etc., on lemon and orange trees and rose bushes and vines?—Subscriber, San Diego.

See Cultivator of November 3, containing formulas for all sprays, and turn to section under citrus fruits, which will describe particular insect troubles to be reached by certain sprays.

"Bats in the Belfry."

"Bats in your belfry" and "bees in your bonnet" are common phrases; but we have both bats and bees in the walls of our house, and would like very much if you, or some subscriber, can tell us how to get rid of them. The bats are in the gable, located between the shingles and building paper. The building paper is put on studding before the 1x4 strips are nailed to studding, then the entire attic is ceiled with half-inch boards between studding and rafters. This leaves a space between paper and shingles, where they have located, acquiring access through a small opening in the shingles. The bees are in the angle of an addition level with the second floor. A practical method by which we can get them cleaned out will be very much appreciated.—Subscriber.

Neither of these questions can be answered by the wisest without more circumstances given, and even then we venture the guess that the problems would be difficult to solve. We do not think that fumigation would be successful. If where fumes can be confined, the use of hydrocyanic acid, generated by mixing an ounce of cyanide of potassium, two ounces of sulphuric acid and three ounces of water for every 100 cubic feet of space to be filled, will kill anything that breathes, but presumably the bats and bees are so located that it would be hard to conduct the gas to them. If the attempt is made, it must be borne in mind that the fumes are also deadly to humans. The bee question is the more serious, and unless one can tear away the siding and secure the queen and all brood from which a new queen might be hatched, the bees will persist in coming back. Of course, if all openings could be stopped, that would soon finish the trouble, but that is usually impossible.

Red Spider on Peach Trees.

At what time and how should I treat peach trees which have been defoliated in past years by red spider?—Subscriber, Parlier.

We question whether this trouble has come from the red spider though from the information given it would be impossible to be sure on this point. If it is, spring dust spraying with sulphur mixed with hydrated or air-slaked lime, three parts of sulphur to one of lime, will prove effective. It is possible the trouble was caused by some of the fungous diseases which should have been reached by Bordeaux spraying during the dormant period of the tree.

Guinea Fowl.

Where can I secure male guinea fowl?—Subscriber.

This query with many others like it we pass on to our subscribers. There is continual call for guinea fowls and doubtless some one could make money by keeping them and advertising.

POMONA MFG. CO.
POMONA, CAL.

$15,000 FROM FORTY ACRES.

By A. O. Gilbertson, Mason City, Iowa.

An Iowa farmer who has produced some wonderful records of profit by growing special crops, and who has shown by his methods of scientific farming that the possibilities of our soil are almost unlimited, was sent for by a delegation of bankers and manufacturers in one of our large cities, a few days ago, who were planning to form a company with large capital to put under cultivation a large tract of land. Their idea was to profit by this farmer's experience before investing their money, and they asked him a great many questions about intensive farming—and asked him why he thought it advisable to invest his money in the farming business. Here are the reasons this farmer gave, in his own words:

"There are two great facts staring the American people in the face today, first, the big, steady increase in the population of the country (an increase of more than sixteen millions of people in ten years), which necessarily increases the food demand, second, the limited farm area which produces this food.

"Did you ever stop to think how these two important facts affect the farming business? The big increase in population means a bigger demand for farm products; the limited farm area means that we simply must make our land produce more in order to supply enough of the food we farmers grow to meet this demand; this increasing big demand is bound to bring more men into this farming business, and this means smaller farms in time, for although it is true that the size of Iowa farms has increased during the last ten years, there is bound to be a decrease in the size of these farms, owing to the limited farming area and the increasing number of farmers to farm these lands.

"You ask me 'What is intensive farming?' To me, intensive farming means using thought and judgment in farming, rather than following custom and tradition, applying original ideas and ingenuity in our farm work instead of keeping in the same rut our forefathers traveled and using their ideas in the preparation of soil and growing the same line of farm products that was their custom years ago. By intensive and scientific farming I mean bringing up our soil to the highest state of fertility, and growing on this soil crops that there is a big demand for and a big profit in, thereby getting the most out of our soil—it isn't so much the number of acres a man has as it is what he gets out of each acre. If a man, by special preparation of his soil and by growing special crops or specializing, can make more money with forty acres of land than he can with eighty, or even one hundred and sixty acres, it is a good paying proposition to farm forty acres right instead of trying to farm a large tract of land.

"I will bring up at this time one special crop to bring out what quality means in crops to the man who is in the farming business, and also to show the profit there is in growing special crops. We started with one acre of onions more than a quarter of a century ago. This one acre has grown to forty acres, and we have never been able to supply the demand we have had for these onions. Our crop records for the last ten years show an average of 600 bushels per acre per year for these ten years, and the average price during this time was 64½ cents per bushel, making our average income for the last ten years for these forty acres more than $15,000 per year. I mention this to show the returns of intensive farming or specializing.

"Now I will show that points of high quality can be bred up or brought about by scientific selection and restriction, and what they mean in actual profits. When I started out, a good many years ago, to breed my special onion, I started with an ordinary flat Weatherfield, as globe onions at that time were almost unknown, and at the start I set up a certain standard to work for; first, long-keeping quality, so that this onion might be placed on the market after other onions were out of the way; second, size and increased yields, to make the venture profitable; third and fourth, a perfect globe and high color, to make the onion popular on the market; fifth, a small neck, to obviate the occurrence of decay caused by rains entering at this point; sixth, a mild, sweet flavor. In the selection of my seed stock or bulbs every year I always had these points in view, and selected my seed bulbs from year to year as near as possible so as to eventually bring about these conditions.

"Now we will take for instance the selection of the seed bulbs in producing a long-keeper. Of course I will take it for granted that you all know that onion seed is produced from the bulbs kept over one winter and set out the following spring. Instead of doing like the majority of seed growers in the North, freeze up my bulbs during the winter to keep them from sprouting, and setting out the frozen bulbs in the spring, I keep my bulbs in a warm cellar to bring out any tendency in these seed bulbs to sprout, and by rejecting every spring all bulbs that show any such tendency, and by carefully carrying out this practice from year to year, I have produced a strain of both red and yellow globe onions that I have on several occasions kept over one year, or, in other words, kept one season's crop until the next fall, when our next year's crop was matured, and by looking at the two different crops even an expert could not detect which crop had just been harvested and which crop had been kept over from the previous year.

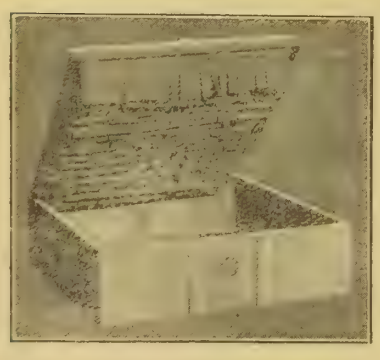
"These other points of quality have been brought about in much the same way. This fall, when the price of ordinary onions was 90 cents per bushel, we were selling our onions at $1.25 per bushel, and are holding the biggest part of our crop to sell next spring, when we hope to get $2 per bushel. I have never had to accept the ordinary market price that is paid for ordinary onions, but always get a fancy price on account of these points of quality.

"I wouldn't advise any farmer to discontinue the farming of his present farm at once, and it isn't my idea to advise the farmer with the average sized farm to go into the truck gardening business, although there is money in it. My idea is to take a certain crop and specialize in it in connection with other farming. This crop wants to be something in the table product line and something there is the greatest demand for.

"Now, you gentlemen have asked me if I think it advisable to invest a large amount of money in the farming business. Your money is safer in the farming business than in any other business, but you want to put men in charge of this business that are experts in their line of work, because this is an age of experts, and this applies to farming as well as any other business, and the farmer of today is keeping in touch with modern methods by reading the up-to-date agricultural journals and all the literature he can possibly get on this important subject of farming."

SUCCESS Fireless Brooders

$3.00, $5.00 and $6.50



INDOOR

We pay the freight. Send today for full description of them. They will raise stronger and better chicks than any heated brooder device ever made. Our prices on all Incubators and Brooders are many dollars less than others ask. See these prices:

60 Egg Size, $9.00; 130 Egg Size, $14.00; 360 Egg Size, $25.00; 612 Egg Size, $40.00.

We pay the freight. Free 48-page book.

75 Chick Indoor Fireless Brooders, $3.00; 150 Indoor, $5.00; 150 Outdoor, as shown in cut, $6.50. We pay the freight. Write us today.

We manufacture and sell at wholesale rates. You do not pay us any agent's profits. When you buy from an agent you lose 25 to 30 per cent of the price you pay, as that is their profits. Buy from us and save that money. Investigate today.

Entomology and Bees

HOW I PRODUCE A CROP OF EXTRACTED HONEY.

By J. W. George, Imperial.

In order to make a crop of extracted honey, I begin operations at the close of the preceding season. The first step is to leave at the last extracting lots of honey to carry the colony over, and then some. About the first of December I again examine all colonies, by lifting, to see if by any possible mistake some had been left short on stores; any light ones I may find are provided with more stores, either by transferring combs from some that have a surplus or by feeding some of my own honey that came from my own bees, or sugar syrup, but it has been many years since I have fed any syrup. After having supplied all colonies with plenty of stores, my next move will be about the first of February, when I remove all supers and reduce them to one story. If there is more honey than can be put in the one story, then I leave as many of the second stories on as the exigency requires. After that step I go through all broodnests and mark my queens as to whether they are good, bad or indifferent. At the same time I rearrange the broodnest, by placing the brood next to the east side of the hive, leaving one frame of honey containing pollen next to the wall. My hives face north and south.

I hear some fellow say: "Why put the brood next to the east wall? It is better in the center." I thought so at one time, but listen: The sun comes up in the east, consequently will warm the brood earlier in the day on that side than in the middle or the west side of the hive, and, being warmed up earlier in the morning, your brood is affected more hours during the day by the above arrangement. Then, in the second place, by placing your brood on one side of your hive you conserve the heat generated in the nest, for the heat can radiate in only one direction from your bees, as the wall of the hive holds the heat in on one side. When my bees begin building up, I want them to go ahead as rapidly as possible.

The middle of February I again examine queens or brood, as it is by the brood we must judge our queens, and mark them again. I frequently find a queen that is marked poor at the first examination coming up at the second or third to a first-class showing. At the second examination of queens I make provisions for supplementing all of the queens that I am satisfied are poor, and quite often practice spreading brood. But let me say right here, in capitals, be very careful how you spread brood, for I have made very serious mistakes in this, and I have seen others do so, too. Now, I want you to keep this before your mind's eye, that I am simply stating "how I produce a crop of extracted honey."

One more examination of queens along the first part of March, and at this examination I eliminate all queens that are not "making good." By the first of April my colonies are boiling over with bees, combs are being whitened, and I proceed to put on my extracting supers. I use eight frames in my extracting supers. When I put my supers on I raise one or two combs from the broodnest that have new honey which is being stored, but no brood.

As soon as one-third to one-half of the honey in the hive is sealed over I begin to extract. I usually take every frame that has any honey in it out at the first extracting. I use a honey box that will hold the frames from three or four colonies at a time. My honey is wheeled in in a wheelbarrow. I use a hot honey knife for uncapping, and "George's" capping melter to melt the cappings. I use Root's automatic extractor, both the four and the six frame sizes, but I prefer the four frame size. I run my honey into a large tank, and let it remain there until I am ready to make another extracting. I extract not oftener than every two weeks. I use practically the ten-frame hive, with eight frames in the extracting super. Now, in conclusion, let me tell you what counts as much as anything with the production of a honey crop is to always be "on the job" personally.

The bee keepers convention in Los Angeles recently called out the largest attendance that organization has ever had.

Orange Trees

Mr. Grower:

This is your opportunity to get some of the finest stock on the market while we are in the humor to close it out quickly. Fine, robust trees, and we will make attractive prices on this block of

500 Washington Navels

1200 Valencia Lates

The trees will caliper ⅝ inch one inch above the bud, and carry the Germain guarantee of true to name. Write for price.

700 CAMPHOR TREES.—A splendid lot of symmetrical trees, 6 to 9 feet high, in five-gallon cans. They are fine evergreens for yard and street and will be sold cheap.

THE A. I. ROOT COMPANY, Box 49, Medina, Ohio

"Let There be Light."

—PAT HENRY, before the battle of Bull Run.

We are not sure that our old friend Pat has been correctly quoted, neither do we know that he was anywhere near Bull Run during that memorial event, but we do know that every Rancher, Miner, Dairyman, Stableman and Teamster on the Pacific Coast should be in possession of at least one of our Vehicle Headlights, here illustrated.

There are times when a good, strong light is almost indispensable. It is needed around the barn, the thrasher, the harvester, on the gangplow, on your wagon or buggy when driving over rough roads, the ranch, the mine or the dairy.

A Boesch Vehicle Headlight is worth a dozen ordinary hand lanterns. They are well made, strong and durable, each one is fitted with a highly polished silver plated parabolic reflector which concentrates the rays of light with remarkable brilliancy. The body is finished in a rich glossy black with polished brass trimmings, and for appearance it is first in order of handsome lamps. It embodies all our latest improvements, and for efficiency as a light producer it is without equal. This is the Headlight that caused the passing of the State Law prohibiting the hunting of wild ducks by artificial light. It is being used by nearly every Fire Department on the Coast and in many of the large Eastern cities.

Do not be led into buying a cheap, inferior lamp. It won't pay. This one is the result of forty-two years' experience in the business. It is home industry, and we guarantee satisfaction. It is made in 6, 8 and 12-inch sizes, measurements across the face.

We also manufacture many other styles of Headlights, Lamps, Lanterns, etc., too numerous to mention.

Write for Catalogue and full particulars of lamps or lanterns that you require.

Crop Specialist Tells

How To Make Your Land Pay $500 TO 1200 Per Acre

That may sound like a story—but I am here to tell, to show and to prove that a profit of from $500 to $1,200 per acre is within the reach of every farmer or grower in the country. I have made this remarkable record on my farms for several years—other farmers who have adopted my methods are also succeeding—the same success is within your reach. The secret of this wonderful profit is scientific and intensive farming, special preparation of soil and the growing of special crops.

Write For My Two Free Books

Book No. 1 is my intensive farming book, not a catalog, published to sell for 50c; send and get it now free; tells of my experiments and experience for the last 32 years. It has taken 32 years to write and to complete it. If you will at least spend 32 minutes reading it it will prove to be the most profitable time you ever spent. This book explains my special method of soil preparation, how to rotate crops, how to make your land pay big profits as I have done by growing my Grandpa's Pride Globe Onions which have produced an average profit of $15,000 on 40 acres and other special crops.

Book No. 2 gives the history of the Alton Improved Red Raspberry which has produced an average profit of $1,200 per acre on account of its remarkable size, flavor, long fruiting season and vitality.

Write for my books today, they are free and will interest the man who is looking for big profits.

A. O. GILBERTSON, CROP SPECIALIST,
Box 615 Mason City, Iowa.

I Have Farmed For 32 Years

During this time I have experimented, my one aim was to produce special crops that would be out of the ordinary in quality and profit. One of the most successful experiments was with raspberries. Instead of growing the ordinary variety and taking an ordinary profit I propagated a special variety now known as the Alton Improved Red Raspberry that has stood the winters of Northern Minnesota, North and South Dakota and even as far north as Canada, without the least winter protection. The Berry is especially remarkable for its size and delicious flavor as well as for its long fruiting season, which on an average extends over a period of three months. If you only have a city lot or if you have a farm investigate this wonderful, large, delicious berry now.

Timely Ranch Suggestions

SEEDING SPRING ALFALFA.

The first thing to be considered in seeding either spring or winter alfalfa is the leveling of the land. Where the slope is such that the field may be laid off regularly it should be done in this way; but if the slope is irregular, it would be better to arrange the border so that each one is as nearly level as possible. Be sure that the land between the borders is level, and that the checks are at intervals frequent enough to insure holding a heavy irrigation on all parts of the field. For leveling, an ordinary farm level, costing $18.00 to $20.00, will be found to be very useful, and will save much trouble and expense in leveling large tracts of land and laying out ditches. Large borders are preferable, but should be shaped so that the harvesting machinery will pass over them easily and with as little jolt as possible. These may be built up on old sod by hauling in dirt, but it is much more economical to prepare them before seeding, by use of a Fresno or other scraper. The seed bed should be well fined, by the use of plow, harrow, and drag; and a clod crusher should be used if the soil is at all inclined to be lumpy.

There are two well accepted methods of seeding: in dry and in moist soil. When seeding in dry soil, the seed may be scattered with a breast seeder, wheelbarrow seeder, by hand, or with a grain drill. When seeding with a grain drill, care should be taken to avoid covering the seed too deeply. Set the depth to suit the alfalfa, and allow the wheat or other nurse crop to be seeded more shallow than if it were grown alone. The seed should not be covered an inch deep; ½ to ¾ inch being the proper depth. A very satisfactory method of seeding is with an ordinary force feed wheelbarrow seeder mounted on a sulky weeder. Such a machine will scatter the seed uniformly, and will cover them at the same time. Broadcasted seed should be covered lightly with a drag harrow, brush drag or other light instrument.

Seeding in moist soil may be done in the manner just described for seeding in dry soil, provided there is no danger of the surface soil drying out before the young plants are up; but the safer method will be to use a press drill.

Alfalfa may be seeded with or without a nurse crop. When such a crop is used, it should be wheat or barley, in preference to oats, as the latter has the disadvantage of drying out the soil very quickly. The rate of seeding the nurse crop should not exceed three pecks to the acre, and the crop should be harvested before maturity if the young alfalfa plants are showing signs of suffering.

The greatest danger to the young plants is at the time of the first irrigation after they are up. If the water is very muddy delay the irrigation, if there is any prospect of better water in the near future. Even with the best water, great care should be exercised on heavy land where the water is apt to stand in parts of the field for a day or more. Avoid, if possible, letting the water entirely cover the plants; and drain off any excess water from the lower ends of the borders in a very short time after the irrigation is completed.

As alfalfa is an expensive crop to seed, and is expected to occupy the soil for a number of years, the greatest care should be exercised to see that all the field conditions are as nearly perfect as possible; because faulty seeding is often the cause of poor stands and unprofitable crops. —J. H. Squires, Agronomist, New Mexico Col. of Ag.

WHAT TO DO WITH THE GRASSHOPPERS.

The present generation seems to have failed to make use of its opportunities. There is an important problem which we have not considered. This is man himself.

Grasshoppers as Food for Man.

John the Baptist ate grasshoppers and wild honey, and did mankind a service on the diet. We have known for a long time that grasshoppers have been and are eaten by many people in different parts of the world; but it is somewhat of a surpries to learn that this article of diet was used and advocated by an eminent entomologist in this country.

Mr. C. V. Riley, first government entomologist, and the founder of what is now the bureau of entomology in the United States department of agriculture, was entomologist in Missouri during the devastating raids of the Rocky Mountain locust that did so much damage in western Kansas and Nebraska nearly half a century ago. In his eighth report he tells his experiences and makes his recommendations.

He says: "It has long been a desire with me to test the value of this species as food, and I did not lose the opportunity to gratify that desire which the recent locust invasions into some of the Mississippi valley states afforded. I knew well enough that the attempt would produce ridicule and mirth, or even disgust, the vast majority of our people, unaccustomed to anything of the sort and associating with the word insect or 'bug' everything horrid and repulsive.

"Whenever occasion presented, I partook of locusts prepared in different ways, and one day ate no other kind of food, and must have consumed, in one way or another, the substance of several thousand half-grown locusts. Commencing the experiment with some misgivings, and fully expecting to have to overcome disagreeable flavor, I was soon most agreeably surprised to find that the insects were quite palatable in whatever way prepared. The flavor of the raw locust is most strong and disagreeable, but that of the cooked insect is agreeable and sufficiently mild to be easily neutralized by anything with which they may be mixed, and to admit of easy disguise, according to taste or fancy. But the great point I would make in their favor is that they need no elaborate preparation or seasoning, and that they really require no disguise; and herein lies their value in exceptional emergencies, for when people are driven to the point of starvation by these ravenous hosts, it follows that all other food is scarce or unattainable. A broth, made by boiling the unfledged Calopteni for two hours in the proper quantity of water, and seasoning with nothing but pepper and salt, is quite palatable and scarcely to be distinguished from beef broth, though it has a slight flavor

peculiar to it and not easy to be described. The addition of a little butter improves it, and the flavor can, of course, be modified with mint, sage and other spices ad libitum. Fried or roasted in nothing but their own oil, with the addition of a little salt, they are by no means unpleasant eating and have quite a nutty flavor. In fact, it is a flavor, like most peculiar and not unpleasant flavors, that one can soon learn to get fond of."

The objection that a fondness for this unusual article of food is due to an idiosyncrasy of the author is overcome by further evidence, for we read later: "I sent a bushel of the scalded insects to Mr. John Bonnet, one of the oldest and best known caterers in St. Louis, master of the mysteries of the cuisine; he made a soup which was really delicious, and was so pronounced by dozens of prominent St. Louisians who tried it."

Now let us be up and doing. It is plain that the philosopher is right when he says that the high cost of living is our own fault.—S. Arthur Johnson, Colorado Agri. College.

TREATMENT OF GRAIN SEED FOR SMUT.

By E. M. Freeman, Minnesota State Farm.

Not all smuts are alike. Corn smut is different from wheat smut and both are different from oat smut. Most of these smuts can be prevented by a simple seed treatment. Such smuts are among the most important. There is no excuse for such smuts on any farm in Minnesota. The simplest and cheapest method of seed treatment is the formalin method.

Smut Preventable.

The following smuts can be prevented by the formalin treatment described below: Wheat smut, (called also stinking smut and bunt, and the most common and worst smut in the state), oat smut, and the covered smuts of barley. Corn smut, the loose smut of wheat (blackheads), and the loose smut of barley, will not be prevented by this treatment. If you treat your barley with formalin you will not get rid of the loose smut. The best way to get rid of both barley smuts is to get seed from a field of last year that did not have any smut in it.

Treatment.

The following is the formalin method: Get good guaranteed formalin from a reliable druggist. The seed grain should first be very thoroughly cleaned. One pound (1 pint) of formalin should be poured into from 40 to 45 gallons of water, in a barrel. Then the grain, in gunny sacks or wire baskets, should be dipped into the solution, or the solution should be sprinkled upon the grain. Be sure that all of the grains are wet all over by the solution, as the object of the treatment is to kill all of the smut-dust on the outside of the grain. Everything which the grain touches should be very clean; sacks should be boiled; floors and shovels should be thoroughly washed with boiling water. If the grain is to be dipped, it may be put, about half a bushel at a time, into a coarse sack and plunged into the formalin solution. Now spread the treated grain on a floor or canvas which has been washed with boiling water; cover it for 12 to 24 hours, and then let it dry. Care should be taken not to allow the grain to freeze when wet, or to sprout.

Another.

The grain to be treated may, instead of being dipped, be spread out in a thin layer on a clean floor or canvas. Then, while one man rapidly shovels or rakes over the grain, another applies the formalin by means of a good sprinkling can, taking care to moisten every kernel. Cover 12 hours, as in the dipping treatment, and then dry.

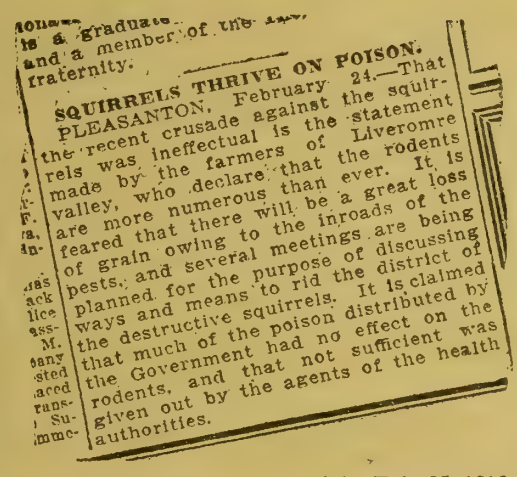
The grain may be sown at once, or may be kept for a month or more if thoroughly dried. Great care should always be taken not to let smut-dust get on it after treatment. Sacks, shovels and the seeder with which it is sown should all be carefully washed with strong formalin solution (1 pound to 10 gallons of water). If carefully done, this should prevent the occurrence of the three smuts mentioned.

STANDARDIZATION OF GRAINS.

The Dry Farming Congress has begun active investigation into the work that has thus far been accomplished along the line of standardizing Western grains. This is a subject which has not had as much attention as one might suppose. There is now a great demand for the establishment of standards that may be acceptable and helpful in maintaining better cropping results in the wheat-growing states.—Dry Farming Bulletin.

HALL'S SQUIRREL POISON

—READ THIS—



...and a member of the ... fraternity.

SQUIRRELS THRIVE ON POISON.

PLEASANTON, February 24.—That the recent crusade against the squirrels was ineffectual is the statement made by the farmers of Livermore valley, who declare that the rodents are more numerous than ever. It is feared that there will be a great loss of grain owing to the inroads of the pests, and several meetings are being planned for the purpose of discussing ways and means to rid the district of the destructive squirrels. It is claimed that much of the poison distributed by the Government had no effect on the rodents, and that not sufficient was given out by the agents of the health authorities.

Clipping from S. F. Chronicle, Feb. 25, 1910

Wanted—Sour and Trifoliate orange, apple, pear, cherry and plum seedlings. Elk Grove Nursery, Elk Grove, Cal.

Wanted—Good, young,- solid color, regis tered Jersey bull. Good record. D. W. Ellis, R. D. 6, Santa Ana, Cal.

Wanted—One thousand seedling orange trees from three-fourths to one inch in diameter, sour stock preferred. John S. Adams, R. R. 2, Box 20, Pomona, Cal.

MACHINERY.

For Sale—Second-hand windmills, gasoline and steam engines, pumping outfits complete or separate. Also wagons, buggies, harness, plows, scrapers, mowers, rakes, header, baler, road grader, road roller, Hurst two-horse sprayer, mining hoist, sundries.

15 Windmill Outfits,
8, 10 and 12 foot sizes with tanks and pumps complete, or separate.
Several Gasoline Pumping Plants.
Tanks, Tanks, Tanks.
from 50 gallons to 50,000. Have special prices on two 30,000 and one 50,000 gallon.
Complete Brick Yard
including all modern machinery for 50,000 daily capacity, including one 100 H. P. Boiler, brand new, also one 60 H. P. boiler, and 50 H. P. engine, 50,000 new brick $3000 plant complete or separate. This material must be closed out immediately at sacrifice prices, as the S. P has purchased the grounds and material must be moved. Why buy new material when we save you half and guarantee all material. Get other's prices, see us last. Call at office of Demmitt Company, upstairs, 120 N. Main, Los Angeles.

Agricultural Implements—Vehicles.
Splendid values, lowest prices, liberal credit given by our retail department. See us without fail before buying. Catalogues mailed to out-of-town customers. A personal call will show you that we have the best and largest stock in the southwest. We are now doing the largest wholesale business and intend to build up our new retail department. Arnott & Co., established 1892, 112-118 South Los Angeles St., Los Angeles.

For Sale—One No. 3 Ames pump, 8 in. cylinder, $250; one Fairbanks-Morse 22 H.P. engine, $450. Also for a short time only I offer a 45 H.P. White & Middleton engine, air starter, for $700. 1½ miles north of Olive, ¾ mile south of Richfield. I. H. Gulick, Olive, Cal.

For Sale—Complete pumping plant consisting of Ames No. 2 seven-inch cylinder head; 180 feet of rods, 180 feet eight-inch O. D. casing, 12 H.P. Daniel Best engine; all in good condition. Will lift from 12 to 15 inches water. Price $350. P. C. Bashore, Covina, Cal.

For Sale—25 H. P. Fairbanks-Morse engine, has been used but short time. Will guarantee like new. Baillie & Brandt Co., 943-945 N. Main St., Los Angeles, Cal.

For Sale—9 H. P. portable gas engine on heavy running gear. Guarantee for one year goes with it. Machinery Exchange, Main & Bruno Sts., Los Angeles, Cal.

For Sale—A good portable drilling rig, good for 800 ft., complete string of tools. About half its value, at $750.00. Address M. H. Magie, 1242 Harvard Blvd., Los Angeles, Cal.

HORTICULTURAL PRINTING.

The Kruckeberg Press, 123 South Los Angeles St., Los Angeles, Cal., makes a specialty of Horticultural Printing and Engraving. Cuts and illustrations of all standard, economic and ornamental plants on hand and subject to the use of patrons without cost. Samples and estimates cheerfully furnished. Remember, we design, write, engrave, bind and print; in brief, do the "whole thing," at no additional expense to the customer. Correspondence a pleasure.

FARM LANDS FOR SALE.

For Sale—By owner, good farm land, $50 per acre, in Merced County, 9 miles from Merced and ½ mile from station on S. P. and 4 miles from La Grande on Santa Fe. This land is a rich, sediment soil, situated in the Artesian Belt and an abundance of water is thus assured. Is level and all under cultivation. No alkali, and is suitable for figs, corn, alfalfa, beans, and all farm crops. Will subdivide in lots from 40 to 1000 acres. This land is very cheap at the price. In fact, it is only one-half the price of other land in same locality. For further particulars, call or address Paxton, 612 Lankershim Bldg., Los Angeles.

Perris Valley—Quarter section of 154 acres fine level alfalfa or sugar beet land; station and side track on land, near new sugar factory. All in grain with sure prospect of good crop which goes with the land. $100 per acre, part cash. Another quarter, 160 acres, near Riverside, slightly rolling; grain, orange or eucalyptus proposition; $75 per acre, very easy terms. Address owner, Chas. S. McMillan, 300 S. Marengo Ave., Alhambra, Cal.

For Sale—In Dinuba, Tulare County, California, 20 acres, 2 miles from town in splendid location on main road to Reedley. 12 acres in Thompson seedless grapes, which come into bearing next year; 8 acres unimproved. Will sell this piece cheaper than any of the surrounding property in order to make a quick sale. Price $225 per acre. Write to Sibley & McCormick or Barrett & Green, or D. H. Kash, Dinuba, Cal., about this property, which is lot 36, Producers' Colony.

For Sale—$125 per acre, 160-acre ranch in Owens River Valley, 2 miles from county seat. 12 acres Stayman Winesap apples, 50 acres alfalfa, 60 acres farming, balance pasture. Entire ranch soil suitable for apples and pears or farming and alfalfa. 100 inches water continuous flow, non-assessable. Would consider one-half exchange in Southern California. Address Owner, Box 52, Independence, Cal.

24 Acres in the Famous "Orland Project," 18 acres alfalfa, 6 acres bearing oranges; all irrigated by the U. S. Government; Orland's best soil; small residence, barn, dairyhouse, etc.; right in town, and will double in value in a short time; worth $12,000 now if cut into city lots. Will sell for $8,000 for a short time. Address owner, J. Vance Wilt, Box 71, Orland, Cal.

For Sale—A 20-acre farm for $20 cash and $20 a month; possession now; $90 to $125 per acre; your crops pay for the land. Rich, level land for alfalfa, oranges, almonds, grapes, cows, chickens; abundance of ditch water, for irrigation, for $1 an acre a year. Where else can you get this? In Oakdale Colony, near good town and railroad station, climate delightful. T. Wiesendanger, 207 S. Broadway, Los Angeles, Cal.

For Rent—475 acres, or any part thereof exceeding 100 acres, in the GREAT YAQUI VALLEY, Sonora, Mexico. You can get two full crops a year off this land and it is worth a profit of not less than $50.00 an acre per year. Tenant can have this land on 3-year lease at a very small crop rental. Address Box "O," Cal. Cultivator.

Business

STOP IT QUICK.

Pattiway, Cal., Mch. 4, '11.

Cultivator Co.,
Dear Sirs:

Please stop my ad in a hurry and send me bill. I've received enough inquiries in one mail through my ad in your paper to sell this whole country. Your paper is surely IT when it comes to getting results. I may send you another ad soon.

Yours respectfully,
Wm. T. Mantz.

USE CONCRETE.

With the development of the farming industry upon a strictly commercial basis has come the use of concrete to a greater extent than ever before. It is at once firm, durable and sanitary to an extent equaled only by solid stone. But the expense is very much less. You can build your own blocks, make your own posts and construct irrigation pipe at very low cost.

Mr. T. A. McMurtrie, who has recently enlarged his place and moved into new quarters at 1085 Forty-fifth street, Oakland, manufactures machinery with which these various shapes in all sizes can be made with but little trouble and small expense.

You would do well to write Mr. McMurtrie for his catalogue. It gives illustrations covering his complete line, together with prices and descriptions. It is highly interesting and instructive.

BALDWIN'S WHITES.

Frank E. Baldwin of 38 Washington Avenue, San Jose, surely has a long string of blue ribbons for his magnificent strain of White Leghorns. His birds have won these ribbons, not only all over California, but at the A-Y-P Exposition and other out-of-the-state shows. Mr. Baldwin is not only breeding for blue ribbons; but for blue ribbon producers, and he is winning in his effort. His yards are located in The Willows, a sandy loam section of the Santa Clara Valley near the city of San Jose.

Factories for making sugar from beets have been established in 17 states, distributed generally throughout the West. The states having more than one factory are: California, 10; Colorado, 16; Idaho, 3; Michigan, 16; Utah, 5; Wilconsin, 4. Those having one factory are: Arizona, Illinois, Iowa, Kansas, Minnesota, Montana, Nebraska, New York, Ohio, Oregon and Washington. The combined area planted to beets is given at 420,262 acres. The factories utilized 4,081,382 tons of beets last year and produced 1,024,938,000 pounds of sugar. Sugar in the beets ranged from 14.24 per cent in Idaho to 17.61 in California and for the entire country gave an average of 16.10 per cent.

THE BIRD "THAT TAKES THE CAKE."

The American Eagle's a noble bird,
The American Turkey is great,
The American Goose is the "pick o' the flock,"
The American Duck's up-to-date.
The American Quail when served on toast
Is a bird that's not bad to take,
But the American Hen, with her cheerful lay,
Is the Bird that "Takes the Cake."

General Household Notes

"THE MAN WITH THE HOE."

Edwin Markham.

"God made man in His own image, in the image of God made he him."—Genesis.

Bowed by the weight of centuries he leans
Upon his hoe and gazes on the ground.
The emptiness of ages in his face,
And on his back the burden of the world.
Who made him dead to rapture and despair,
A thing that grieves not and that never hopes,
Stolid and stunned, a brother to the ox?
Who loosened and let down this brutal jaw?
Whose was the hand that slanted back this brow?
Whose breath blew out the light within this brain?

Is this the thing the Lord God made and gave
To have dominion over sea and land;
To trace the stars and search the heavens for power;
To feel the passion of eternity?
Is this the dream He dreamed who shaped the suns
And pillared the blue firmament with light?
Down all the stretch of hell to its last gulf
There is no shape more terrible than this—
More tongued with censure of the world's blind greed—
More filled with signs and portents for the soul—
More fraught with menace to the universe.

What gulfs between him and the seraphim!
Slave of the wheel of labor, what to him
Are Plato and the swing of Pleiades?
What the long reaches and the peaks of song,
The rift of dawn, the reddening of the rose?
Through this dread shape the suffering ages look;
Time's tragedy is in that aching stoop;
Through this dread shape humanity, betrayed,
Plundered, profaned and disinherited,
Cries protest to the Judges of the World—
A protest that is also prophecy.

O masters, lords and rulers in all lands!
Is this the handiwork you give to God,
This monstrous thing distorted and soul quenched?
How will you ever straighten up this shape;
Touch it again with immortality;
Give back the upward looking and the light:
Rebuild in it the music and the dream;
Make right the immemorial infamies.
Perfidious wrongs, immedicable woes?

O masters, lords and rulers in all lands!
How will the future reckon with this man?
How answer his brute question in that hour
When whirlwinds of rebellion shake the world?
How will it be with kingdoms and with kings—
With those who shaped him to the thing he is—
When this dumb terror shall reply to God
After the silence of the centuries?

FOWL MARYLAND STYLE.

Cut up a well dressed fowl in the usual manner, and place in cold water for a half hour or longer to whiten. Drain off the water, and, after putting in a kettle, add just enough water to steam until tender. Fry out the fat from a few slices of salt pork, dredge the pieces of fowl with flour, salt and pepper, and fry quickly until nicely browned in the hot fat. Pour a cup of thin cream over the contents of the frying pan, season with salt and pepper, and serve on a deep platter.

PAULINE'S TIGER.

She was a dear little slip of a girl, with hair that was almost golden, but not quite, and eyes so brown; but I must say she did have freckles, and her nose was just a wee bit inclined to be snub.

She lived in a little white house, in a pretty little town of just the right size for children to be happy in, I think; for there were broad, shady trees, where runaway horses were scarce, and motor cars were unknown in those days; for my story goes back some twenty years or more.

Pauline (I was so busy telling you in what a delightful place she lived that I really forgot that you did not know her name as well as I do)—well, Pauline went to school in a big, white, wooden school building, with a big, square bell tower on the top of it. Every day when the first bell clanged out, away ran Pauline, her book and slate under her arm. She loved flowers, and always carried the first lilac blossoms and the last glorious maple leaves in the fall to her teacher.

It was her second year at school. Now there were some big girls in the schoolrooms just above Pauline's room, who were very fond of her. They had taken her up, this spring term of which I write, and made her their particular pet. At recess they played that Pauline was their little girl or their scholar. They gave her bites of their cookies at noontime, and often—very often—took exceedingly large bites from her russet apples.

Now Pauline's mamma hardly liked this, and said it would be better for her to play with the girls of her own age, and that she was afraid the older girls would get her into mischief yet.

Well, one day these big girls asked Pauline if she wouldn't like to go to the Queen's Garden—the woods beyond the meadow—to gather wild flowers. They said they would come and get her in school hours and make it all right with Miss Bell, the teacher. Pauline, who had never been out in the woods before without her papa, or her big brother John, hesitated. She remembered the story her mother had been telling a few weeks before, of the wildcat she had seen in the woods when a little girl, and hesitated yet more. But just then Mary Jane Sykes said: "Oh just think, Pauline, how nice it will be to have a big bunch of flowers to give Miss Bell in the morning!" Then Pauline consented.

About two o'clock there was a tap at the schoolroom door, which Miss Bell answered. Mary Jane Eykes stood there.

"Please, ma'am," said she, "Pauline's mother wants her to come home now."

Miss Bell told Pauline she could go.

When Pauline heard the naughty story which Mary Jane told she was sorry; and then she thought of the woods and flowers. So she put on her little cape, and brown straw hat, and skipped gayly along with the other three girls.

Miss Bell looked out of the window, and I think she thought it very queer that three big girls with baskets, should come for Pauline to go home.

They walked to the end of the main village street, down a big hill, over a bridge, and across a beautiful, river-bordered meadow, right into the loveliest of big woods.

For a long time Pauline was very

happy. She was sitting near a big log, in the midst of a quiet patch of adder's tongues, picking as fast as her little fingers could fly. Not far away the other girls were busy in a violet bed.

Left alone, Pauline began to think what Mother would say; for her shoes were muddy, and there was a long tear in her new calico dress. Thinking of her mother made her recall the wild-cat story. Just then she heard a rustling, snapping sound. She turned her head, and there, staring at her from a hollow log, were two big, yellow eyes. Her blood ran cold. She felt her hair fairly rise up from under her straw hat. For a moment she was spellbound; then rushing to her feet, she ran, screaming: "Oh, girls! A tiger! a tiger!" The spring blossoms, wake-robins, blue-bells, violets, adder's tongues and anemones fell heedlessly to the ground as the girls rushed, terror-stricken, through the woods.

By this time school was out, and there were some big boys in the outskirts of the woods cutting fish-poles. The girls told them that Pauline had seen a tiger—a live tiger—in the woods. After much coaxing they persuaded her to go back and show them the place where she saw it. With a beating little heart she showed them the way, and, hearing no growls, they approached the log, and what do you think they saw? A tiger? No. A big, yellow-eyed, white owl, which was easily caught. The boys looked at poor little Pauline with scorn. Sobbing she picked up her fallen blossoms and went home and told her mother all about it.

Mother listened, but did not scold; for she knew her little girl had learned a good lesson that day.

The next morning Pauline took her flowers to Miss Bell. Miss Bell looked at the spring blossoms with one of her queer little smiles, and said, with her arm about Pauline:

"Pauline, my dear, were you happy in the woods yesterday afternoon?" Then Pauline told her all about it, and how she thought she was going to be eaten by a tiger for running away from school.

Although Pauline is a big, big lady now, she says when she feels like being naughty—and you know grown people do feel that way, too, sometimes, my dears—she thinks of those big, yellow eyes.—The Independent.

USEFUL HELPS FOR THE GIRLS.

You can make pretty and inexpensive jabots by cutting a plain linen handkerchief diagonally in half and then trimming the edges with pretty lace. These jabots are made by the folding of a central box pleat, with two or three small pleats in each side turned centerward and then pressed into shape.

If a white waist or any white article needs bleaching, wash clean, then rinse out the suds and put them to soak over night in clear water in which cream of tartar has been dissolved in proportion of a teaspoonful to a quart of water, then rinse and starch in the morning. You can clean a lace waist by rubbing magnesia thoroughly over the garment, rubbing it well on the most soiled places; then roll it up carefully in a cloth and lay it away for several days. Grease spots can be removed from silk and woolen goods by covering the spot with magnesia and then covering with brown paper and placing a hot flat iron over the paper.

To wash white or any delicate colored woolen goods, make a thick lather in cold water with a small quantity of soap bark; now add hot water till the whole is moderately warm, then it is ready for washing, and when clean rinse in clear water and dry in the shade.

For sore lips, chapped hands and roughness of the skin, there is nothing better than a cold cream made of melted and strained mutton suet to an equal part of glycerine with a few drops of oil of rose added, and this is cheaply and easily made.

To make the finger nails of good shape, push back the skin at the base of the nail with a soft, dry towel each time the hands are dried Each finger should be dried separately by pressing from the tip of the finger down to the palm. Some girls have ruined their complexions by using an injurious face powder, but many girls are preserving a good, smooth skin by using borated talcum powder as this makes the skin as white as desired and takes away the shine. There is nothing better to use than this powder if the skin is inclined to be greasy. Dust the parts of the body where perspiration is troublesome daily with this powder and there will be no odor. Dust the hands with powder before putting on the gloves and it will keep the skin soft and make it much easier to slip on the gloves.—A. M. H.

FOR SERVING ORANGES.

Oranges in their natural state are exceedingly wholesome and appetizing; eaten before breakfast, stimulating and invigorating generally. The old Spanish proverb says: "Oranges are gold in the morning, silver at noon, and lead at night;" but it seems this could be true only of those of weak digestion.

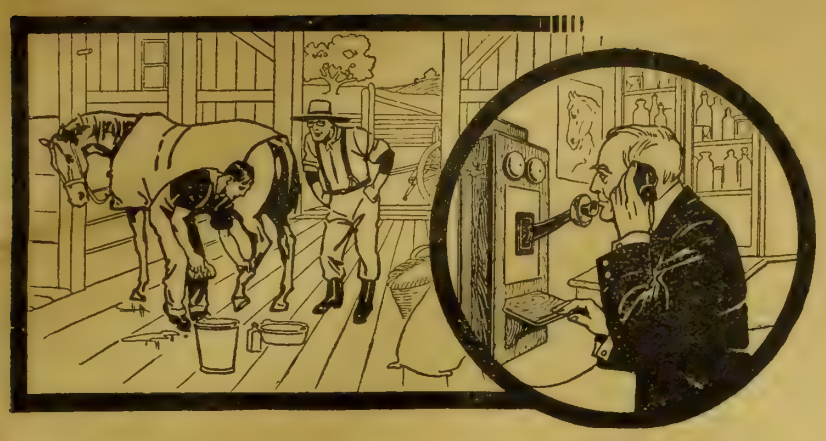
The plainest, easiest of all ways to serve oranges as a dessert is to cut them up with sugar; but even this can be done well or shabbily—be made delicious and attractive, or to look very uninviting. After peeling, every particle of the white, bitter, inner skin should be removed, and the fruit cut in moderately thick, uniform pieces. Granulated sugar should be liberally sprinkled along between the layers, and generously on the top. It should be made ready a full hour before serving. We all know how much prettier fruit, especially oranges, look in a glass dish than any other, showing the yellow through the crystal.

Cold Dessert.

A cold dessert of oranges is made in this way: Make a syrup of one pint of sugar and half a pint of water. Peel and cut up the yellow, inside pulps, enough to loosely fill a large bowl. Now, to the syrup add one ounce of dissolved isinglass, and the strained juice only of two lemons. Simmer for ten minutes and pour over the cut oranges till the bowl is full. When cold set upon the ice. Serve with sweetened whipped cream.

Another.

In a saucepan wet one heaping spoonful of cornstarch in a very little water. Over this pour one pint of boiling water, stirring constantly. Add a generous pinch of salt, and one cup of sugar, the juice of two large oranges and of one lemon, strained, with the grated peel of the oranges. Cook and stir for five minutes, then stir in the beaten yolks of three eggs, and cook for three minutes more, stirring briskly. Then remove from the fire, and stir in the whites of the three eggs, beaten to a stiff froth. Allow to stand till quite cold in the sauce-



Indispensable in Emergencies

THE sickness of a valuable animal on the farm demands prompt remedies.

It's a case for the veterinary—a case where minutes count. That's where the Bell Service shows its value to the farmer.

By means of the telephone the veterinary is reached, and he at once tells the farmer what to do until he arrives.

No far-sighted farmer gets along without the protection of the Bell Service.

He can never tell when it is going to save him from serious loss. Besides, he has daily proof of its usefulness.

Consult our local manager for rates.

pan, and then put in a glass dish, to serve it from, and put it on the ice.

With Gelatin.

Another delicate orange dish is this: Soak one ounce of gelatin in a little cold water, and then pour over sufficient boiling water to make one pint. Strain this upon a platter, and when cold beat in the whites of three eggs till it begins to foam and stiffen. Then add a coffee cup of sugar, a good pinch of salt, and the strained juice of three large oranges and one lemon. Beat all together till very light, then put in glasses, with a spoonful of whipped cream on the top of each. Keep a while on the ice, to serve cold.

Pie.

Orange pie is a delicious dessert, and can be very good when plain as well as when rich. The plain rule is as follows: Grate the yellow peel off one large orange and mix with the juice of two, add one cup of sugar, and the beaten yolks of three eggs. Beat the whites to a stiff froth and beat into it one cup of milk, then mix all and bake in a puff paste. This is a richer pie: Four eggs, two spoonfuls of butter and one cup of sugar, all beaten to a cream; with the juice and grated rind of two oranges, and half a pint of whipped cream, added last, all beaten together, and baked in a rich paste for twenty-five minutes in a moderate oven.

Orange Cake.

Bake in four layers, as for any other jelly cake, the following: Two cups of flour, two of sugar, one-half cup of water, the yolks of five and the whites of three eggs, a pinch of salt, one teaspoonful baking powder, and the juice and grated rind of one orange. Some oranges give out so much more juice than others that no exact measure of flour can be given; but if two cups leave the batter thinner than ordinary cake, a little flour must be added. Bake delicately. Beat the two remaining whites to a stiff froth, add the juice of one orange, sweeten to the taste with powdered sugar, and spread between the layers of cake when cool. Desiccated cocoanut added to the filling makes a pleasing change. Or lemons may be used instead of oranges.

Orange Pudding.

Peel and slice three or four oranges and lay in a pudding dish, with half a cup of sugar; make a custard with one pint of milk, the yolks of three eggs, one spoonful of cornstarch and one-third of a cup of sugar. When cold pour over the oranges, beat the whites of the three eggs to a stiff froth, with powdered sugar spread over the pudding, and brown delicately in the oven.

A Rich One.

Stew six large apples and pass through a sieve; rub together a small cup of sugar and the same of butter, and stir into the apples while hot. After taking the skin and pith from four large oranges, chop very finely and add to the other ingredients. Beat the yolks of six eggs light and add lastly, reserving the whites for the meringue. Bake in a rich paste. Flavor the frosting with orange juice.

A FEW WORDS OVER AN UMBRELLA.

Black—"Be sure you return that umbrella I just let you take!"

Brown—"But look here, old man, this is an umbrella you borrowed from me six months ago!"

Black—"No matter, I'm more careful of my things than you are!"—Woman's Home Companion.

Just Six Minutes to Wash a Tubful!

This is the grandest Washer the world has ever known. So easy to run that it's almost fun to work it. Makes clothes spotlessly clean in double-quick time. Six minutes finishes a tubful.

Hay.

Scott, Magner and Miller say:

Arrivals of hay for the week ending today amount to 1,740 tons, as against 2,545 tons last week, and 4,167 tons the preceding week. It is now generally conceded that we will have a large crop of hay. During these heavy rains there has been a little more demand for hay in the interior, which will probably continue until such time as the rains cease, as a little sunshine will make grass grow very rapidly at this time of the year, and naturally cut out quite a little of the stock feeding in the interior.

Export demand has been quite good, several steamers having loaded this week for Hawaii, and the government has taken somewhat of hay for export.

Alfalfa seems to be in little better demand, and receipts are smaller on this commodity.

We quote the wholesale prices in round lots on today's market, as follows:

Fancy wheat	13.00@13.50
No. 1 wheat or wh and oat	10.00@11.00
No. 2 wheat or wh and oat	9.00@10.00
Choice tame oat	10.00@11.00
Other tame oat	7.50@9.50

Citrus Fruit Market

LOS ANGELES, March 15, 1911.

Instead of shipping about 200 cars per day, as was expected for the Navels, only about 125 is the average. This is caused by the storms preventing picking during several days. The shortage has also compelled a material advance, and Navels are averaging close up to the $2.75 mark, f. o. b. East. The shipping is now going forward at a much more rapid rate. Monday's shipments reached the big total of 272 cars, and within a very few days every section will be pushing forward sufficient to make up, in part at least, the loss during the first of the month. Some icing is being done, also precooling, which is caused by occasional showing of decay. On the whole, the quality of fruit is excellent.

The demand for lemons has been on the increase, though it has not yet reached the stage of causing material advance in prices. Every offering made is picked up, and the warmer weather over the East would cause advance.

Shipments.

Shipments of oranges to date since November 1, 1910: 13,205 cars; lemons, 1,753; total, 14,958. To same date last season: Oranges, 8,808; lemons, 1,411; total, 10,219.

LOS ANGELES, Friday, March 10.—Two cars navels sold.

CITRUS GROWERS CONVENTION.

(Continued from Page 323.)

ity coming from the use of potash salts and acid phosphate. Besides, lime nitrate is equal, unit for unit of nitrogen, with sodium nitrate, and much safer for the correction of acidity in all soils, arid or humid.

Hall states that lime nitrate is laid down in English ports for $40.65 per ton, and "Berkeland calculates that the cost of manufacturing calcium nitrate containing 13 per cent of nitrogen is about $19.36 per ton, and that it can be sold at a profit of $38.72 per ton, which would be equivalent to nitrate of soda at about $48.40 per ton." California should turn a sufficient amount of the power of her mountain streams to account in the manufacture of calcium nitrate to meet the needs of her agriculture at a price but a little above the cost of manufacture and the local transportation.

As to the dangers to which we have referred being "purely fanciful and highly theoretical rather than a practical one," a problem in simple arithmetic will show that the addition of two pounds of sodium nitrate to the tree, with 100 trees to the acre, would furnish sufficient sodium for 120 pounds of black alkali or 160 pounds of sodium sulphate, were it all transformed. Where three pounds of the nitrate per tree is added twice each year, the sodium, if all converted, would make 360 pounds of black alkali or 480 pounds of the sulphate. Then 50 years of such applications with no removal by crop or by leaching would add five to 15 tons of sodium nitrate per acre, and if all were thus converted without removal by crop or leaching, would leave in the soil from 3 to 9 tons of black alkali or 4 to 12 tons of sodium sulphate per acre in addition to whatever may have accumulated from the irrigation water and soil decay.

We do not say or suppose that such large accumulations would occur, but this statement of the case shows truthfully the tendency and its theoretical maximum magnitude. We are mindful, however, that the agricultural life of California should be far more than ten times fifty years and it will be very much cheaper and more practicable to prevent the undue accumulation of alkalies than it will be to eliminate them after they have increased to the extent of greatly reducing yields or rendering the soils sterile.

We regard this problem of such grave import to the immediate future of orcharding that you should provide ample funds and then demand of your Experiment Station that they go into your orchards and determine positively whether or not there is serious increase of alkalies in your soils under existing practices. A trifling tax properly distributed would provide ample funds and would enable your station to lead practice, as it will be glad to do, rather than wait till fatal consequences develop, to tell you how and why they happened. The same provision would enable them to successfully attack and advance toward solution many of your other serious problems at the same time.

We must continue to bear down, even more heavily, if possible, upon the green manure crops, making them yield their utmost, but they cannot be expected to alone maintain the degree of fertility required for continuous heavy yields.—F. H. King.

Dr. Hilgard's Comment.

Prof. E. W. Hilgard's comment on the foregoing letter is:

Professor F. H. King has sent me a copy of a letter written to you with respect to the matter of black alkali as a result of the free use of nitrate of soda on heavy soils, and requests me to comment thereon as I may think desirable.

I would say, first of all, that Professor King's discussion and warning are entirely correct, as applied to heavy, undrained soils and scant irrigation. The latter is sometimes the result of deficient water supply; and others of improper or inefficient mode of application of the available supply. Professor King goes on the supposition that no leaching occurs in our soils under joint irrigation and natural rainfall, which, at Redlands and Riverside together, amount to about 35 inches per annum; an amount, by the way, in excess of that falling at Rothamsted farm in England. There should, therefore, under irrigation, be quite as good a chance for leaching out of objectionable salts as at the English locality, yet here a visible increase of alkali salts frequently occurs, even on soils not as heavy as those spoken of by Professor King, due simply to incorrect mode of application of irrigation water, as I have for many years tried to impress upon our irrigators. For in the heavier soils, especially, surface flooding and irrigation in shallow furrows allows of evaporation of nearly 50 per cent of the irrigation water used, which, though paid for by the irrigator, is wasted into the air. I have again and again insisted, both in print and by word of mouth, that in Southern California especially, where the water supply is scant, this mode of irrigation should, in orchards at least, give way to irrigation in deep furrows, which would save nine-tenths of the loss by evaporation from the soil surface, and by penetrating to much greater depths give trees an opportunity and a tendency to deep rooting, ensuring them a larger supply of plant food as well as moisture through the season, and with less liability to injury from delay in irrigation. Such deeper penetration, of course, will also tend to leach out whatever surplus of water soluble salts there may be in the soil.

There is, of course, no question about the formation of black alkali from nitrate of soda, or of the injurious effects of that compound upon the tilling qualities of the soil. I think I was the first to notice and discuss this effect, and to prescribe remedies for it. Black alkali, or carbonate of soda, is promptly transformed by gypsum (land plaster) in the presence of water into the relatively harmless white alkali or sulphate of soda. It is obvious then that if each application of the nitrate of soda were accompanied or followed by the application of the corresponding amount of gypsum on the land, the formation of black alkali would either not occur at all, or would be promptly overcome.

This is a precaution that those using large amounts of nitrate of soda on heavy soils should not omit; in fact, it would be just as well to use the two conjointly always, with the understanding that for the full neutralization of the possible black alkali promptly, for every 100 pounds of nitrate of soda used about 160 pounds of gypsum are needed. This is on the supposition that no leaching out whatever should occur.

When acid phosphate is used as a fertilizer it nearly always carries with it a notable amount of gypsum which, of course, will help to prevent injury from black alkali. But whatever is done the establishment of drainage is of the utmost importance wherever irrigation is practiced. The two should always go hand in hand, if only to prevent the accumulation of injurious salts from irrigation water more or less charged with the latter. With irrigation in deep furrows, natural drainage and leaching out will be established in most California orchard soils, for light and pervious soils are the rule, and "adobe" the exception in this state. But where orchards have been established on the latter, the owners will ultimately find it most advisable and profitable to follow the example of the Illinois prairie farmers, who have long ago found under-drainage the most profitable investment they could make in cultivating their heavy black prairie soils.—E. W. Hilgard.

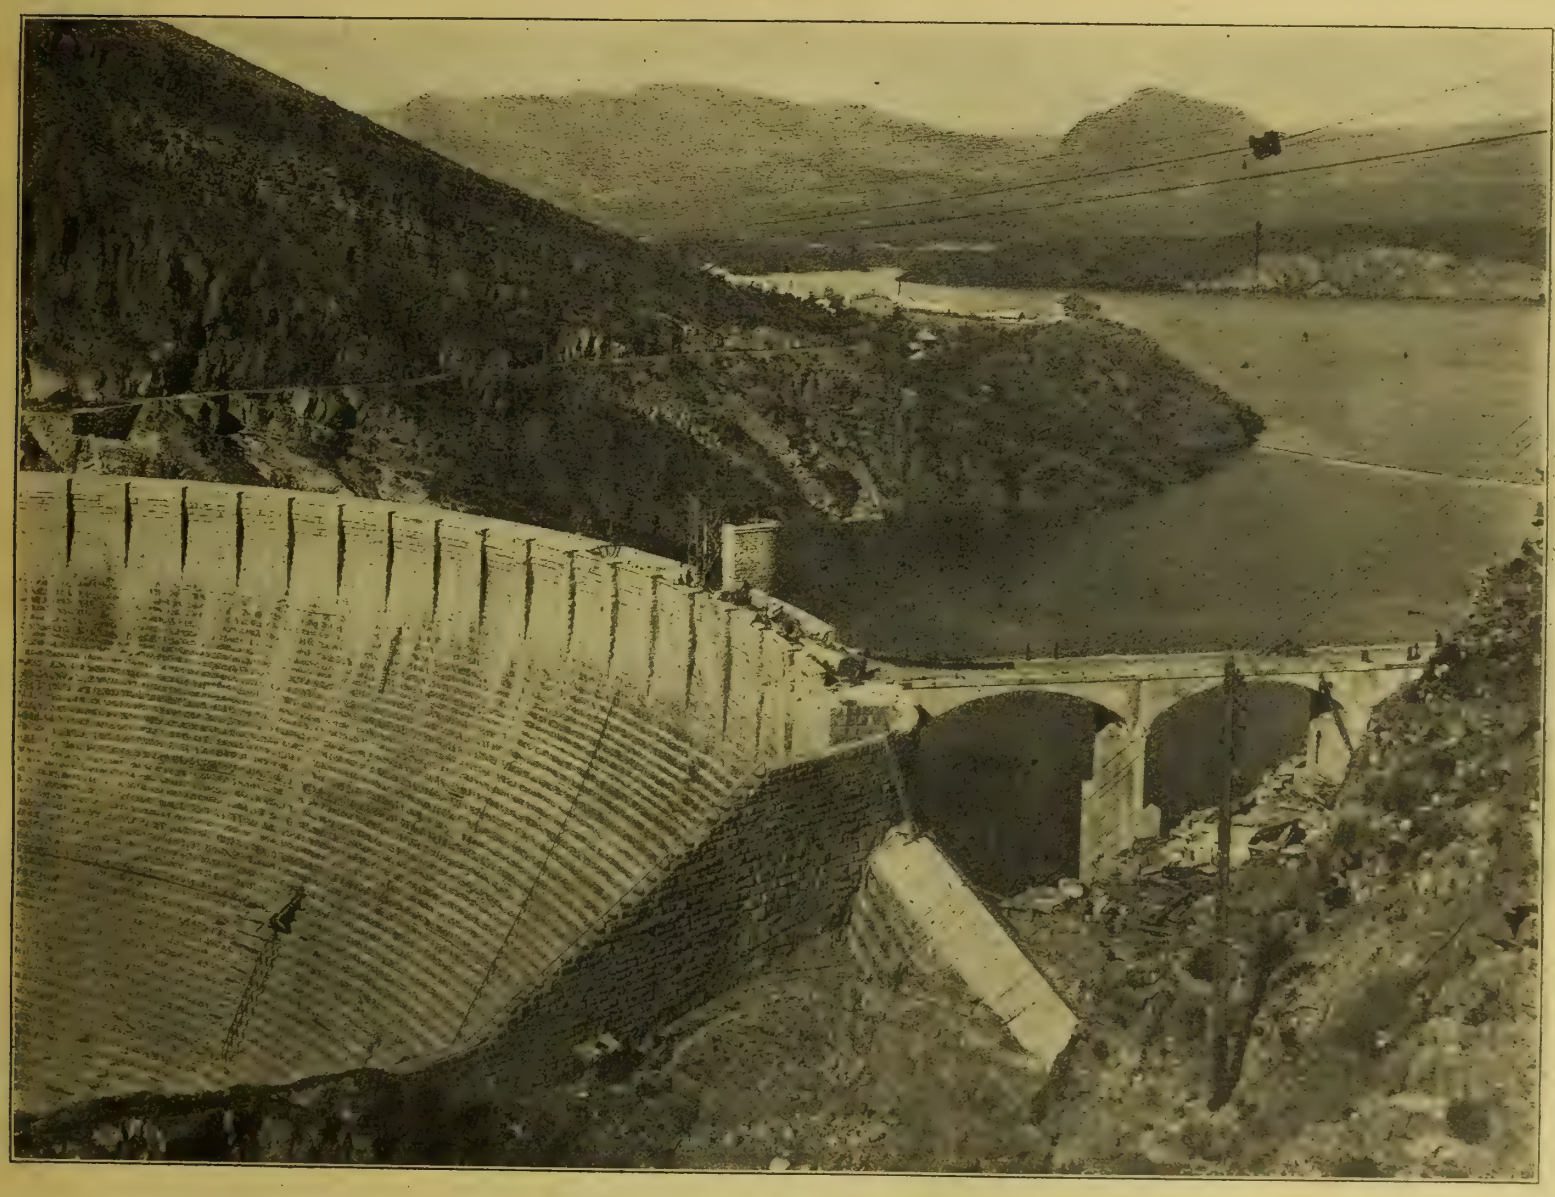
LOS ANGELES MARCH 23, 1911 SAN FRANCISCO



A DREAM THAT HAS COME TRUE

ROOSEVELT DAM.

It was in 1889 that the farmers of the Salt River Valley began to dream of a storage reservoir as a solution of the perplexing irrigation water problem. Investigation of the Tonto Basin country was made and a natural reservoir site was found 76 miles east of Phoenix and half a mile below the junction of Tonto Creek with Salt River.

Washington heard of the dam site and in 1896 Arthur P. Davis, then an engineer of the United States Geological Survey, was sent out to conduct field studies. He spent several months at the site and in that vicinity. Upon his return he made an enthusiastic report.

In 1900 the amount of land under cultivation in the Salt River Valley had increased so greatly that there was not nearly enough water to properly irrigate it all. There was sufficient water in the rainy season, but at such times freshets would carry away the flimsy brush and sand dams, which were all the canal companies could afford to build. Water enough to irrigate thousands and thousands of acres flowed away to the sea every year. When the river subsided so that the dams could be replaced the supply of water in the stream was usually far too small. Farmers were lucky if, in summer, they got stock water. They were forced to see their crops wilt and die.

Something had to be done and a county commission was appointed to devise some plan. Stored water was the only apparent solution. The reservoir site was available, but to build the huge dam required to make the reservoir a reality would cost millions of dollars. The farmers did not have those millions and no private corporation had ever undertaken such a stupendous irrigation enterprise. A little of its story may be seen on page 355.

Rambler Sixty-five

Forty-inch Wheels

THOUSANDS of young men on farms and ranches all over this country are proud to be driving the Rambler today. In the Rambler the healthy boy finds recreation when his tasks are over, a sense of responsibility and pride in driving such a car and a pleasure exceeding any offered by the town. The boy with a mechanical turn, after he knows about cars, becomes a champion of the Rambler. It has so many little advantages of comfort and convenience, so easy to operate, so economical and so accurately made. The safety cranking device protects you against injury; the Spare Wheel is the only satisfactory solution of the tire problem; the Offset Crank Shaft enables you to glide along quietly behind a loaded wagon on a narrow road or take the hills and deep sand without rushing. These features, with the gasoline lock, adjustable steering pillar, aluminum front floor, accessible engine, self-acting door lock, seven-eighths elliptic springs, big wheels and tires, shock absorbers and large brakes, are appreciated by the young man who has learned what a motor car should be.

The new catalog is ready—send for it. Ask also for the Farm Owners' Number of the Rambler Magazine. A postal, giving your name and address, will bring these books free.

Vol. XXXVI. No. 12. LOS ANGELES: THURSDAY, MARCH 23, 1911 One Dollar the Year

The Dedication of the World's Greatest Dam

Ex-President Roosevelt Opens the Great Gates and the Floods are Loosened in Formal Dedication. A Happy Day for All Arizona and Especially for Farmers of the Salt River Valley.

Something over 320,000 acres of land in one of the richest valleys on the continent was made available for intensive cultivation when Ex-President Roosevelt threw on the current which raised the great bronze gates of the Roosevelt dam in Arizona on last Saturday. The lake formed by this dam is the largest artificial body of water in America, extending back into the valley over 20 miles and covering about 25 square miles. It will hold sufficient water to flood 2000 square miles one foot deep.

This immense dam, requiring over four years' work and costing in the neighborhood of $3,500,000, is 280 feet high, length of base 235 feet and top 1080 feet. The dam is higher than the Flatiron building in New York and would hide the capitol at Washington to the dome. Two four-in-hands can pass on the top. Most of the wall rests on stones big enough for a team and a wagon to stand on and weighing sixteen tons each. The lands below the dam which will be irrigated by its waters will make 25,000 farms, each able to support five people. It has been estimated that each one of these acres will yield crops from $50 to $150 in value. The cost of the project will be about $3.50 per acre a year, or about $800,000 a year, and the power alone, which will be developed, is worth more than $2,000,000 a year.

While the act of Ex-President Roosevelt formally dedicated this great project, last year while the work of construction was under way, waters were accumulated to the depth of 100 feet without in any way interfering with operations. While this was only 15 per cent of the capacity of the reservoir, it enabled the ranchers of the valley to produce over $2,000,000 worth of crops in one season, using only one-third of that storage water. At the present time the water in the dam is about 160 feet in depth, amounting to 450,000 acre feet of water, only about one-third the capacity of the reservoir, and it is filling rapidly.

The soil chiefly is a sandy loam, a clay formation appearing in places. For the intensive cultivation of semi-tropical fruits, cereals and alfalfa probably no section of the nation is more suitable. Five railroads will afford splendid transportation facilities. Thus with profitable markets almost adjacent the Salt River Valley is destined to become one of the thriftiest agricultural regions in the United States.

When fully completed the dam will have involved the expenditure of $3,009,991.33, and the 230,000 acres which will be irrigated by it are entirely in the Salt River Valley, Arizona. Dairying and alfalfa raising will probably be the greatest factors for some years, but many fruits will be found to do exceptionally well here. In the higher and more protected mesas oranges and lemons of highest quality have been produced. The elevation of these lands is from 1000 to 1300 feet and the average mean temperature is about 70 per cent.

A Bit of History.

While Washington heard of the possibilities of the reservoir site in 1896, many investigations were made and much effort was necessary on the part of territorial representatives. It was several years before active work was taken up. From Arizona, a magazine, we quote as to some of the earlier history:

"Two more years rolled by. Conditions had not improved, but the Salt River Valley farmers were still hopeful.

"Finally the Hansbrough-Newlands bill, better known as the reclamation act, was passed by Congress. It was approved by President Theodore Roosevelt June 17, 1902. There was grave danger for a time that the bill would be drawn in such a way as to exclude the Salt River Valley from its benefits. Originally the measure was designed to reclaim only public lands, and not those in private ownership. Earnest work by B. A. Fowler, George H. Maxwell and others resulted in an amendment, just prior to the bill's passage, permitting the construction of irrigation works for privately owned lands.

"At that time the Reclamation Service was only a bureau of the Geological Survey. The report of the service dated December 1, 1902, contained the initial plans for the Roosevelt dam, then called the Tonto dam, drawn by Mr. Davis. Afterward the plans were changed to provide for a dam thirty feet higher than Mr. Davis projected it. It was found that the cost of an additional thirty feet would be trifling, compared with the vast increase in the reservoir's capacity which would result.

"The Salt River project was tentatively authorized by E. A. Hitchcock, secretary of the interior, March 12, 1903. Preparations to construct the greatest storage dam ever undertaken proceeded apace. In that year the Salt River Valley Water Users' Association, which has since served as a model for similar organizations throughout the West, was incorporated.

"One of the first things to be done was to build a road from Mesa, the nearest railroad point in the valley, to Roosevelt, a distance of sixty miles.

"To build the Roosevelt road, now one of the most magnificent scenic highways in the world, cost $206,000. The cities of Phoenix and Mesa, realizing the great benefits which would accrue to them from the dam, contributed $71,500. Phoenix bonded herself for $67,500, and Mesa for $4,000. Since the completion of the road, $147,000 has been spent in betterments and improvements, making the total cost $353,000.

"In March, 1905, the road was completed. Already the Reclamation Service had a force on the ground making preliminary preparations for the building of the dam itself. April 8, 1905, the contract for the construction of the dam proper was let to J. M. O'Rourke & Co. on a scale of yardage figures that it was estimated would total $1,147,600. The company was to have the dam completed in two years to a height of 150 feet, provided the government did not delay in furnishing material. Various penalties for delays on both sides were provided for. Unforeseen delays were numerous and the contractors secured several extensions of time. Just what they received on completion of the work has not been made public.

"Two things were absolutely necessary before work could be commenced: They were lumber and cement. A government sawmill was established in the Sierra Ancha mountains, thirty miles to the northeast, and 3,000,000 feet of lumber was sawed and hauled to Roosevelt before the contract was fulfilled.

"Machinery for a cement mill was hauled from Mesa and Globe and the plant established at the dam site. It had a nominal capacity of 300 barrels a day, but an actual capcity of 450 barrels. This mill furnished 338,452 barrels of cement for use in the dam, at an average cost of $3.14 a barrel. The lowest bid the government had been able to secure was $4.89. To produce the cement which went into the Roosevelt dam cost $1,063,542.36, and the saving effected was $592,000, an average of $2.50 for every acre of land in the reservoir district. This is merely one instance of the foresight and business judgment used by the Reclamation Service officials.

"Power was required, and first a temporary steam electric plant was erected. Later it was replaced with a temp rary hydro-electric plant, and finally a permanent hydro-electric power house with a capacity of 800 horsepower was installed.

"In November, 1905, a coffer dam was being thrown across the river by the contractors. On November 27 a flood carried out the coffer dam as well as the flumes that were to carry the water over. Some machinery was also washed away. This caused the first delay. The flumes were never replaced. No excavating for the foundation was done until a sluicing tunnel had been driven through the solid mountain around the south end. The capacity of the tunnel was sufficient for the normal flow of the river.

"September 20, 1906, the first stone of the foundation was laid. The last stone of the coping on top of the dam was laid February 5, 1911. From the time that the actual laying of masonry commenced, progress was fairly steady. Delays intervened, but contractors and government employes toiled with a mighty persistency, overcoming one difficulty after another as it arose. Though the undertaking was from the very first known to be stupendous, no one had any conception of the work that must be done before the dam was a reality.

"One effect of the progress made was to inundate the site of the town of Roosevelt. When Roosevelt was built it was known that the very work in which its inhabitants were engaged made it a "city of numbered days." As the dam grew, the water behind slowly rose to the level of the town. Finally the entire population moved to the present site on higher ground.

"On its lower side the dam presents a sloping face, the structure gradually growing narrower from the foundation to the top. On the upper side the face is nearly perpendicular. At the top the dam is 680 feet long, and its total length, including the bridges over the spillways, is 1,080 feet.

"Water is released from the reservoir through three outlets. Turbines in the power house, a stone structure just below the dam, are fed by an immense penstock of steel, running through the dam about half way up its side. This is near the south end. Skirting the north end, almost under the spillway and driven through the rock, is tunnel No. 2, 115 feet above the river bed. Its sole purpose is for releasing water when the reservoir shall contain it above that elevation and when it is desired to release a greater volume than will pass through the penstock.

"Under the terms of the reclamation act the land owners of the reservoir district must pay back every cent the project has cost, excepting a stipulated sum the Indian Bureau will contribute because of the benefits the Indians will receive. It is also hoped that within a few years the revenues accruing from the sale of electric power, all of which goes to the farmers, will be sufficient to meet the annual payments. The debt must be paid in ten years from the date the dam is formally opened. A special arrangement has been made whereby the payments will not begin until two years after completion, following which they will be made in ten yearly installments. These payments will be made through the Salt River Valley Water Users' Association, in which each acre represents a share.

"During the years that he was president, Theodore Roosevelt took a deep interest in the undertaking, and more than once he made it possible for the Reclamation Service to secure money to carry on this, its "show project," when it was feared that a shortage of funds would force a temporary cessation of construction work. It was for him that the town of Roosevelt and the dam itself were named, and the reservoir is known as Lake Roosevelt. On March 18 Theodore Roosevelt will formally dedicate the dam which bears his name and which he did so much to make a reality instead of an irridescent dream."

LARGEST CITRUS NURSERIES IN THE WORLD

Parties contemplating the planting of citrus groves this coming spring will do well to send for our prices soon, as there will evidently be a shortage of strictly first class stock. Write today for particulars, or, better still, pay us a visit so that we may be able to show you just what we have.

Our finely illustrated booklet, "Citrus Fruits," covering the industry from the seed to the market, mailed to any address on receipt of 25c in stamps.

Citrus and Tropical Fruits

GRAPEFRUIT IN SOUTHERN CALIFORNIA.

By C. F. Baker, Pomona College, Claremont, Cal.

When Americans began settling in considerable numbers in Cuba, their attention was early turned to the possibilities of citrus culture there. The island abounded in half wild seedling orange trees, many of which, however, bore very superior fruits. Scale insects of many varieties occurred there, but were held in check by fungous parasites and ladybirds, and though also other more serious pests, such as a pernicious root borer, exist there, still the settlers began the active planting of citrus fruits. They ordered stock in large quantities from Florida. Usually the orders were for certain definite varieties, which were soon exhausted in the Florida nurseries. The nurserymen then filled out the orders with anything that they happened to have in the nursery rows. The result may be imagined. In a single ten-acre grove may frequently be encountered trees of Pineapple, Parson Brown, Valencia, Navel, Joppa, Jaffa, St. Michael and several others. Exactly the same condition resulted among the grapefruits. Florida has always been famous for her grapefruit, and varieties have multiplied there. Cuba can produce just as good. But the difficulties in harvesting and marketing these orchard mixtures were colossal. Solid block planting is a necessity for the economical handling of most fruits. Apart from other difficulties, the growers did not know enough about them to correctly distinguish the various varieties which their trees turned out to be, and their fruit had to be marketed simply as "grapefruit," whether Marsh Seedless, Duncan, Pernambuco, Hall Excelsior, Walters, Royal, Triumph or McKinley, or a mixture of all of these.

It became my solemn and perilous duty while in Cuba to undertake the identification of these varied mixtures of oranges and grapefruit, and I carried this work on for several years with many very interesting results. I return to California, "where everything is done right," and I find here, too, a most remarkable job lot of grapefruit scattered through the groves. Moreover, I find many growers who do not know the varieties they possess. Others more confident, will name them, but if I carry the same fruit to others, equally confident, I am quite likely to get other names for it.

Now, it is my humble opinion that California is capable of producing just as fine grapefruit as either Florida or Cuba. Eventually, I believe that this state will yield a finer product, since we have here a more all-alive community, and more vigorous, radical and up-to-date methods. We are now awaking to the fact that we have never yet taken the first step towards broad, thorough, systematic effort in applying modern methods of plant breeding to our citrus fruits. A little haphazard and unsystematic selection here and there, tells the whole story to date. We are now at the opening of a new era, and I expect to live to see the day when we will have a Navel orange or a Marsh grapefruit better in every respect than the average of today, and in addition possessing but four or five sections. What breakfast fruits they will make, and how rapidly they will replace the sorts we are getting along with today! There may be bud sorts even now existing in some California orchard that will yield such fruits. I have already seen individual fruits that were definite promises of such possibilities. We can beat the world along these lines if we will get at the work actively enough.

The existing named varieties of grapefruit were each named from some single parent type, and that particular type carries the name always. However, every fruit grower knows of the wide individual variation that occurs within the limits of any variety, and also the wide variation from the type in some character, that may be produced by varied surrounding conditions. If the variation be not too wide, we still recognize the variety. And how? Simply by approximating it to the original type which it most nearly resembles. A great trouble has always faced us in the fact that neither our orange or grapefruit varieties have received the more systematic and careful comparative treatment that has, for instance, been given the avocados, by our Mr. F. W. Popenoe. With the works of Hume, DeLong, or even of Risso or Bonavia, in hand, one must simply flounder about among many closely related varieties, with about as even chances of being wrong as of being right in his conclusions. Some few varieties are marked by very conspicuous characters which are almost always unmistakable, such as the orange-likeness of Aurantium, the sweet flesh of the Royal, or the pink flesh of the Tresca. But for the most part decisions have to be based upon judicious examinations of the character of the surface and the thickness of the skin, the shape—especially form of base and apex—the number of sections and seeds, shape of seeds, character of pith, and so on, and also occasionally the character of growth and foliage. Taking the fullest descriptions of the varieties that have been given and carefully comparing them, we find many pairs of varieties that can scarcely be separated so far as the current descriptions go, by any characters that are of good diagnostic value. In Hume's work, for instance, compare the descriptions of Hall and Josselyn, Walters and Excelsior, May and McKinley, and Hall and Triumph. Nothing will take the place of being thoroughly acquainted with these things in the field. Have we any permanently established breeding gardens where one may see enough typical examples of all these varieties of authentic origin, and brought to characteristic and perfect development? Can we secure any firm foundation for breeding work or exact knowledge, by absolutely ignoring pedigrees? Hundreds of our growers would go far to visit such plantings. Certainly in the case of the grapefruit, such a fundamental knowledge must precede any really serious work in selecting or breeding. Indeed, I believe that such planting should exist in every distinct type of region that we have, the common property of the orange growers themselves, and governed by them, and such plantings would be of immense service and rich in information, apart from all other considerations. Our growers are now only definitely organized for the business side of citrus work. I believe that there are just as cogent reasons for organization to promote research, investigation and production. The condition of the grapefruit in Southern California today is only one of many evidences of our needs in this direction.

CHLOROSIS AGAIN.

Referring to your remarks on chlorosis, presumably of citrus trees, in March 2nd issue, headed "Up a Stump," the subject is now being much discussed among the citrus fruit growers. My contentions in my Pomona paper have been generally sustained by later observations.

As a matter of fact there are many causes of chlorosis in citrus trees, one being too much lime. The amount of lime necessary to produce this effect will vary with other features of environment. For instance, a smaller percentage of lime will produce the effect if there is standing water about the roots of the tree; and possibly the water condition named might itself prove a sufficient cause.

I have found very few instances where lime has been sufficient to do harm in this way, and then it would be limited to one or two trees.

And yet we find incipient chlorosis or mottled leaf in nearly all the orchards in Southern California. We also find the thrifty orange orchards practically co-extensive with the condition of two or more parts available lime to one part of available magnesia when these plant nutrients are determined in solutions made with a weak solution of hydrochloric acid, in which the soil sample is boiled for not more than half a minute. I have found that in some few cases where the ratio is bad the orange trees are not mottled, though otherwise in bad condition. This is probably due to the magnesia being more amenable to solution in so strong a solution as that I use.

Without doubt this magnesia-lime question is one of the fundamental ones with the citrus fruit grower in this part of the world. As we all know, lime is in greater demand by plants than any other of the mineral nutrients, and thus becomes one of the basic needs of plants. It is also thoroughly established by Loew and others that the assimilation of lime by the plants is interfered with by a relatively large amount of magnesia.

Available lime is the crying need of the citrus orchards in Southern California, and it must be used in allopathic or even heroic doses; for when two tons of air-slaked or carbonate of lime per acre are applied, it is but a little over .02 of a per cent in three feet depth of soil.

With the present light on the subject I incline to believe the ground limestone is the cheapest form, while this and gypsum, finely ground, are the best for large applications frequently used, so as to bring up the lime content rapidly.—R. R. Snowden, Chemist and Soil Engineer.

We note Dr. Snowden's statement "Without doubt the magnesia-lime question is one of the fundamental ones with the citrus grower, etc." We hope he is correct, for it will simplify many problems now puzzling many, but we will have to take exception to his "without doubt." The discussion at the San Bernardino convention showed there is much doubt in the minds of many who have studied the problem of chlorosis as to whether lime or magnesia have anything to do with it. "When doctors disagree," etc., we laymen will have to wait awhile. The suggestion of the application of ground limestone is however excellent.—Ed.

Surely, none are so full of cares or so poor in gifts that to them also, waiting patiently and trustfully on God for his daily commands, he will not give direct ministry for him, increasing according to their strength and their desire.—Elizabeth Charles.

"I Would Buy a 'NATIONAL' Dress—If I Were You!"

"I have worn 'NATIONAL' Dresses for many years," writes one reader of California Cultivator, "and I find them delightful. I never miss an opportunity to say to all my friends, 'I would buy a 'NATIONAL' Dress, if I were you.'"

"If I were you, I would buy a 'NATIONAL' Dress." And, Madam, so you would—if you knew the ideal we keep before us—to put all possible prettiness into each creation, to have each gown a model of fashion, and to attain the utmost in becomingness and beauty for YOU.

We never select a design without comparison with dozens of other designs—without placing side by side the best models of New York and Paris to make sure that each "NATIONAL" Dress is finer, more beautiful, more satisfactory, as well as incomparably more becoming and stylish.

Copyright, 1911, by National Cloak and Suit Co.

And what of "NATIONAL" Waists, and Skirts, and Hats, and all "NATIONAL" Apparel for Women, Misses and Children? Of every kind your "NATIONAL" Style Book shows you the most desirable and most stylish—always the absolute best. It shows you

Waists . . 98 cents to $8.98
Ladies' Skirts, $3.98 to $14.98
Lingerie Dresses $4.98 to $22.50
Silk Dresses, $11.98 to $29.98
Girls' Dresses, $1.49 to $5.98
Misses' Tailored Suits, $9.98 to $17.98

Hats . . . $1.98 to $14.98
Muslin Underwear, 25 cents to $5.98
Petticoats, 59 cents to $7.98
Misses' Wash Dresses and Misses' Tub Suits, $2.98 to $9.98

And the wonderful new Made-to-Measure Tailored Suits, prices $15 to $40. A liberal assortment of samples of the materials used for these suits will be sent you free, if you state the colors you prefer. Samples will be sent gladly, but only when asked for.

Your Style Book, the copy we are now reserving here for you tells you on page 90 "How and Where the New Styles Originate," pictures for you four "NATIONAL" Dresses in their Paris Home, shows you on page 69 the Paris Originals of "NATIONAL" Dresses; page 75 is a page of wonderful dress values—four beautiful Lingerie Dresses at $6.98 and $7.98.

It is the most wonderful, interesting and valuable Style Book ever published—and one copy is *yours*—is waiting for you to write for it now.

THE EASIEST WAY TO INSURE THE EFFICIENCY OF YOUR IRRIGATION SYSTEM

THE efficiency of your irrigation system depends on the efficiency of the engine that operates it. You may not need to use it for months, but when you do need it, your need is urgent. It means actual financial loss then if it doesn't work. Bear this in mind when you select your engine. Pick out one that is a known quantity—not an experiment.

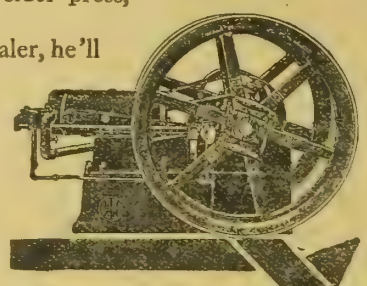
I H C Gasoline Engines are always a safe selection. Their efficiency has been proved. They have years of success behind them. There are thousands in use.

I H C Gasoline Engines

are made in all styles and sizes—1 to 45-H. P.—vertical or horizontal—stationary, portable, or traction. This makes it easy for you to get just the right type and size for your individual use.

Besides supplying power for your irrigating system, an I H C engine can be used for operating the feed grinder, fanning mill, thresher, separator, churn, washing machine, cider press, alfalfa cutter, etc.

If you will call on the I H C local dealer, he'll be glad to show you points of I H C superiority you ought to know about. Ask him for the I H C Gasoline Engine catalogue, or, write the nearest branch house.



Western Branch Houses: Denver, Col.; Helena, Mont.; Portland, Ore.; Spokane, Wash.; Salt Lake City, Utah; San Francisco, Cal.

I H C Service Bureau

What is it? A clearing house of agricultural data.
What does it do? Helps farmers to help themselves.
How can it be used? By sending your farm problems and puzzling questions to the Bureau.
We are co-operating with the highest agricultural authorities, and every source of information will be made available to solve your difficulties. We shall be pleased to have an opportunity to assist you. Write the I H C Service Bureau.

KIRKMAN NURSERIES

TREES THAT GROW AND BEAR TRUE TO NAME

We are wholesale growers of deciduous and citrus fruit trees, grape vines and eucalyptus trees.

Our stock this season includes 650,000 deciduous fruit trees alone. A large lot of these are on Eastern seedling root, which has proven to be almost proof against root knot.

Get the best stock available and at the most reasonable cost from a man who selects the buds and scions of the best strains.

Deliveries made from our sales yards at Fresno, Madera, Merced, Turlock, Banning and Chico.

Write for quotations on your order. Address Main Office, Fresno, Calif.

Wholesale 360 Acres Retail

Smyrna Park Nurseries

Ceres, California

A complete line of Nursery Stock. Special prices on Peach, Plum and Apricots. It will pay you to let us figure with you before placing your order for Spring planting. All stock guaranteed true to name.

Campin & Moffet, Prop's.

Deciduous Bush-Tree Fruits

SPRAY FOR CODLING MOTH.

The spraying season for the codling moth of the apple and pear will soon be here. That spraying is necessary to the production of high-grade fruit no intelligent orchardist will deny, though it is but a few years since some maintained the natural enemies of this pest would be sufficient and allowed the pest to increase. So many markets will now refuse entrance to moth infested fruit that hog food is nearly its only outlet.

Of course, spraying is not an exact science and people who follow spraying are not always exact people, hence many failures. Some occurred in the Pajaro Valley section last year because many used an arsenate not suitable to that section. Thoroughly reliable arsenates are compounded and the spraying may be generally effective.

Be careful, be timely, use good chemicals, a fine nozzle and direct the spray downward into the end of fruit.

Some of the observations of Prof. C. W. Woodworth of the State University given at the Watsonville Apple Annual are timely at this season. Some of his statements pertain only to that valley but all are interesting. From his address we quote:

"We divided the work of codling moth control into three campaigns. The first to consist of the work of putting poison in the blossom cup, the second what other sprayings may be necessary to control the first brood of worms, and the third the sprayings against the later broods. The accumulated evidence of eight years of experimentation and observation all shows that the blossom cup campaign is of no practical value in any part of the Pajaro Valley.

"Upon this point the best practice of our growers stands in most striking contrast with that of many other regions and is most sharply opposed to the recommendations found in the greater part of the literature on the control of the codling moth. At the present time there is something of a controversy between advocates of numerous sprayings and of those who claim better results from a single spraying. Both parties believe in blossom cup spraying and the single spray advocates contend that if the blossom cup work is done thoroughly enough there will be no necessity for any supplementary sprayings. The outcome of the work in this valley is the discarding entirely of the blossom cup work. This does not in any way call in question the value of blossom cup spraying in other regions, indeed, the evidence seems to be conclusive that the single spray method in some regions produces results that are as good as can be produced by any method but simply emphasizes the difference corresponding to the climate of the different localities.

"One condition which renders the single blossom cup spraying an impossibility here in the Pajaro Valley is the long period of blooming. Before a tree is in full bloom one often finds fruit on the tree as large as the end of one's finger. If it were necessary to place the poison in every blossom cup at least three sprayings would have to be given during the blossoming period.

"A second condition rendering blos-

CODLING MOTH IN VARIOUS STAGES

Grand Special Opportunity To Secure Strictly High Grade Trees At Especially Reduced Prices

This is our second and last stock of the season. Trees are all first class in their grade. They are thoroughly dormant and in fine shape for planting. Weather conditions for the handling and planting of trees were never more favorable. Trees planted within the next three weeks will do as well as any planted earlier in the year.

Give us your order for what you can use of the stock and we will make immediate shipment. DO NOT DELAY. NOW IS THE TIME TO ORDER. The season is very favorable for late planting and at these prices it is to your advantage to secure as many as you can set out.

You can order direct from this page as it contains our complete holding at the present time. No correspondence necessary.

We quote the following special prices together with the number of trees of each variety which we have on hand.

TREES

True to Name

THE ADVANTAGES

of being able to get home-grown trees and vines from a reliable concern who use the greatest care and save no expense to supply their customers only healthy, clean stock, "True to Name," are very great. Our 28 years' experience in this business with thousands of satisfied customers all over the west, can best testify to our record for square dealing and superior stock.

We solicit your orders for nursery stock of all descriptions:

PALMS
ROSES
CITRUS
DECIDUOUS
ORNAMENTAL
SHADE TREES
VINES and PLANTS

Let us figure on your requirements.

LARGE PROFITS

Year after year can be made from a well kept up orange or lemon orchard. In fact, there is no more profitable crop that can be raised than oranges, provided the soil and climatic conditions are right.

Our citrus stock is grown under ideal climatic conditions in heavy black loam soil, insuring sturdy, strong, well matured trees with excellent roots.

Now is the time to place your orders as most planting is done in April. We are prepared to fill orders for almost any quantity, no matter how large or small your order may be.

Every fruit grower should have a copy of "California Horticulture" the fruit growers' guide. It gives the best methods and suggestions for planting, pruning and care of stock based on 25 years' actual experience. It is a veritable compendium of information. 120 pages. Beautifully illustrated. Price, 25 cents postpaid.

Annual Illustrated Price Catalog FREE

It lists and describes over 2000 varieties of trees and plants carried by us. Will be sent free if you mention this ad.

SPRAY FOR CODLING MOTH.

(Continued From Page 358.)

som cup spraying inefficient in this valley is the fact that comparatively few of the worms enter the fruit at this point. This difference in the habit of the young worm corresponds with the fact that the fruit is almost always larger before the worm attacks it and in every district where worms attack larger fruit a large proportion enter on the side. Here it is the first generation that makes the side entrance and elsewhere the first generati n attacks the fruit when very small. The same cold, spring weather that causes the long protracted bloomings of the tree holds back the appearance of the moth still more and instead of all coming forth simultaneously, the over-wintering individuals are emerging during two or three months. Most of the eggs are not laid till the fruit is well advanced.

"The basis for the discarding of the blossom cup spraying however was not so much this observation of the peculiarities of the life history as the fact that perfect control, as good as is obtained by any method, is the result of a spraying program which absolutely ignores the blossom cup work. As far as is known none of the orchardists in this valley have ever practiced blossom cup spraying. Mr. Volck has employed the term 'blossom cup spraying' to describe the effort to wet the hairy portion of the apple just outside of the blossom cup, but this is not at all what is meant by the term elsewhere. Others mean the inside of the cup where the pistil and stamens arise.

"Almost complete absence of worms at picking time can be secured when no effort at all is made to control the first generation of the insect. This practice, however, is not to be recommended and is indeed not the present practice of any of the growers. However, if an orchardist desired to make a single spraying do for the year an application in August would give, in this valley, the best degree of control that could be secured by any single application. The reason that generally the first generation produces but little or no loss to the crop is due to the fact that the dropping of a few infested fruit in midsummer simply thins the crop and decreases the number of apples but not the number of pounds of fruit finally harvested. The wormy fruit found at picking time is practically all the result of the work of the later generations of worms and a thorough spraying in August will destroy the larger proportion of these.

"The reason why the single August spraying is not recommended is that while such spraying prevents a large part of the fruit becoming wormy it will not prevent the spots produced by the very young worms before they get enough poison to kill them. These spots are about as conspicuous as those produced by the San Jose scale and, of course, should be avoided as far as possible. A single spot of this kind does not at present cause fruit to be graded down, but it is certainly objectionable.

"The present practice of endeavoring to destroy as many as possible of the first brood is correct according to our present knowledge of the problem provided they are supplemented by one or more later sprayings. Such a large proportion of the apple orchards are sprayed that the wormy apples now allowed to rot on the ground or sent to the dryers are almost entirely due to the neglect of this very necessary part of the program of effective spraying.

"The spraying in August will justify itself in the financial returns from the crop at least equal to, and in most cases very much better, than any of the earlier sprayings. There may be some improvement possible in some orchards by increasing the thoroughness of the application and perhaps also in the better timing of some of the earlier treatments, but in the majority of cases the spring work is well done and all that is necessary to bring up the general average till it fairly approximates the best practice is the addition of the later sprayings. This is, therefore, the one point where we can expect to obtain rapid and tangible results. The general adoption of the autumn spray will add hundreds of carloads to the output of the valley and a corresponding amount to the profits of apple growing in this valley. In these later sprayings the necessity of using a strictly neutral arsenate is particularly apparent. The poisoning effect of the leaves is apparent to everyone, in cases where considerable quantities of soluble arsenic enter the plants; sometimes quite as serious results may come, however, without characteristic scorching. Chronic poisoning, showing itself only in the yellowing and dropping of the leaves early in the fall, presents the development of the full size, sweetness and crispness of the apple. This chronic poisoning of arsenic may result in extreme cases in an almost complete loss of the crop on account of their small size and inferior quality. Fortunately for the growers in this region a perfectly neutral arsenic is obtainable and it is possible to determine both by chemical and foliage tests the character of such an arsenical and there is no longer any excuse for omitting this spraying which otherwise would be so dangerous as to render it problematical whether their application would be justifiable. If next year is to see the same advance in spraying that the valley has experienced the last three years it can only be done by improving the spraying practice in the way here suggested.

"At the beginning of my remarks I stated that no equal area in the world showed so universal and efficient spraying. It should not be understood that there are numerous smaller areas that are better treated, indeed, it seems to be generally conceded that many of the smaller valleys in the Northwest produce fruit which averages much freer from culls than does the Pajaro Valley, it should be our ambition to not only maintain the pre-eminence of amount of spraying, but to produce fruit which will average equal to the best, notwithstanding the fact that in some particulars we have greater difficulties to overcome."

According to the experts of the North Dakota Agricultural College, damage to trees by rabbits gnawing the bark can be stopped in the following way: Make a thick whitewash; slacking the lime over night improves it. To each pailful of the whitewash add three tablespoonfuls of Paris green, and paint the trees with it. Stir frequently when applying it.

High hearts are never long without hearing some new call, some distant clarion of God, even in their dreams; and soon they are observed to break up the camp of ease, and start on some fresh march of faithful service.
—J. J. Martinneau.

Genasco

the Trinidad-Lake-Asphalt Roofing

Other roofings all have their drawbacks: Shingles crack, split, and rot; tin rusts; slate breaks and blows loose; coal-tar gets brittle and cracks; so do the many socalled "asphalt" roofings, because they lack the "live" lasting qualities of *natural* asphalt.

Genasco has the natural oils of Trinidad Lake asphalt sealed in it; and they keep the roofing always pliable and strong and defensive against all weathers. Genasco doesn't crack, rot, rust, or break. It is *permanently* waterproof. That means real economy.

It pays to cover the roof of every building on the farm with Genasco. Fully guaranteed.

The Kant-leak Kleet prevents nail-leaks, and waterproofs the roofing-seams without cement. Makes Genasco easier to apply than ever.

Ask your dealer for Genasco mineral or smooth surface Roofings with Kant-leak Kleets packed in the roll. Write us for the Good Roof Guide Book and samples.

NURSE PLANT METHODS OF PROPAGATION.

The U. S. department of agriculture has issued a bulletin in which the subject of "The Seedling-Inarch and Nurse-Plant Methods of Propagation" in connection with tropical and subtropical fruits and ornamental plants is discussed.

The Seedling-Inarch Method, it is believed, is destined to prove of the greatest importance in a very wide range of plant industries in which the early fruiting of a variety is very desirable. This shortening by a year or more of the time required for the fruiting of a new variety is a matter of such unusual importance as to demand the widest publicity among all interested in the cultivation.

While investigating the asexual propagation of some tropical fruit trees and other plants, it was discovered that a large number of hard-wooded shrubs and trees are capable of a very rapid increase when propagated by processes which may be termed the seedling-inarch and nurse-plant methods.

These methods are inexpensive and, owing to their simplicity, may be used by persons without previous experience in the propagation of plants. The ever-increasing number of plant breeders will thus be enabled to save much time in determining the value of hard-wooded plants raised by means of hybridization. The methods can be used in manipulating seedlings of rare trees and shrubs intended for crossing, so that each plant will bloom in a much shorter time than if left to grow on its own roots. Seedlings of all hard-wooded plants resulting from collections made by travelers in foreign countries may thus be brought to the flowering stage and their value determined quickly.

The most remarkable feature of the new methods lies not only in their simplicity but also in the certainty of the unions which result. The writer has very few unsuccessful unions and none among those classes of plants where the most suitable stocks are known and in common use. Not only is it possible to inarch a seedling a few weeks old to a large stock, but a moderate-sized seedling stock can be inarched to a shoot of a rare shrub or tree having the same diameter as the stem of a seedling. A satisfactory union may thus be induced where other methods of asexual propagation have invariably failed.

Very young seedlings of hundreds of rare hard-wooded plants may be worked on the same or allied species or genera and their value determined much in advance of the time when they would flower on their own roots or on plants obtained by grafting or budding from the mature shoots of the seedlings.

Hard-wooded seedlings which need to be flowered in the shortest possible space of time, in order to determine their value, are used for inarching as soon as the first leaves attain a fairly firm texture; but when seedlings are used as stocks for the vegetative propagation of established varieties by uniting the stock to small branches, then larger seedlings are used.

The methods of propagation followed up to the present time have all been more or less faulty and cumbersome. The budding of seedlings in nursery rows requires the service of a trained propagator who knows what to do and how and when to do it. The average cultivator can hardly hope to acquire the skill necessary for the operation; moreover, there is always danger of loss from transplanting budded seedlings. Propagation by the older method of inarching on plants growing in 5 and 6-inch pots, sometimes for more than a year, is an expensive method, necessitating the erection of strong staging around the parent trees for the accommodation of plants in pots; moreover, the roots of the seedlings become curled in the pots and make it difficult to develop a good root system for the future tree. The method now described has the advantage of being by far the easiest to use. Each grower may be his own propagator. With a helper to prepare the seedlings he can easily inarch several hundred plants in a day.

NATURAL VEGETATION AN INDICATOR.

Extensive tracts of land, including thousands of acres that are doubtless capable of producing crops, remain unoccupied in the United States, especially west of the ninety-eighth meridian. In places where no attempt at tillage has been made the would-be settler or investor is often at a loss to know whether the land in view is adapted to a particular crop or even whether it has any agricultural value. In such places the character of the natural vegetation is usually studied as an index of its crop-producing possibilities, but mistakes are often made in using this indicator without sufficient consideration.

As the result of investigations carried on during the past three years in the Great Plains area, the U. S. department of agriculture has issued a bulletin containing definite determinations of the correlations between different types of vegetation and the physical characteristics and crop possibilities of the land occupied by each type. The chief object of the bulletin is to show how the errors resulting from hasty and inconsiderate conclusions may be avoided, and how new lands may be classified with reasonable accuracy on the basis of natural vegetation. The publication is not a report of a land survey, but rather a discussion of methods which can be utilized to advantage in making such a survey.

The work has brought out clearly that the general conditions, whether favorable or unfavorable to crop production, are indicated by the native plant cover.

It is wonderful what a change can be wrought in the appearance of a plain, unattractive farm-house by the simple expedient of building a porch around it, or on one or two sides, and planting some climbing roses. Many an unsightly home has thus been transformed to a thing of beauty.

We never miss an opportunity of giving innocent pleasure, or of helping another soul on the path to God but we are taking away from ourselves forever what might have been a happy memory, and leaving in its place a remorse.—Frances Power

MAKING THE HOME PAY.

"Marketing home products advantageously is of paramount importance," says Kate V. Saint-Maur in Woman's Home Companion for January, "and seems to be the point on which many beginners fail. Commission men and wholesale markets should not be resorted to, because home-grown products of all descriptions excel in quality and not in quantity; therefore, appeal to high-class private custom, who desire the very best, regardless of price.

"I have never sold through any of the ordinary market channels, yet have always had more orders than I could fill and received a little more than the ordinary prices. Naturally the location of the home and the quality of the wares must influence the returns to some extent, but not half so much as the method of packing and shipping. Nicety in these respects captures the favor of customers and they take pride in exhibiting things to their friends—which is the very best sort of advertising a home business can have.

"When I had reached the point where I knew that I could depend on a certain number of eggs regularly, I wrote to a doctor friend in the city and told him that I could promise to deliver six dozen strictly fresh-laid eggs twice a week for the whole year, at a uniform price of forty-five cents a dozen; customers to pay the express charges, which would be twenty-five cents on each six dozen. (Express companies return empty packages free of charge.) Within a month he had found four customers for me, who would take two dozen a week each, the box to be delivered at his house, where the other three customers were to call every Saturday and Wednesday.

"All poultry-supply houses have wooden boxes for sale with divided trays, made to hold three, six or twelve dozen eggs, for about two dollars apiece. Before the year was out each of the three other customers had interested one or two friends, with the result that three six-dozen boxes were shipped three times a week, and the following winter I had orders from the same people for butter and table poultry."

BERRY PRODUCTION.

The production of strawberries has been overdone in Southern California, especially about Los Angeles, until it is predicted that the lack of replanting will cause a partial famine this year.

The acreage planted this year in the principal strawberry growing sections of Southern California is estimated at between 700 and 800 acres, as compared with about 960 acres last year. This shows a decrease of approximately 16 to 27 per cent in acreage and will mean a like decrease in the amount of berries produced.

On an average, each acre will produce about 500 crates, which means that a total of 350,000 to 400,000 crates or 700 to 800 cars will be the yield.

Many of those withdrawing are Japanese, but despite this, the strawberry market this year will, as usual, be controlled by the Japanese. Probably 90 per cent of the strawberry crop will be grown by Japanese growers.

Regarding the output, a Los Angeles jobber is quoted in a daily paper as follows:

"Half or more than half the crop will be consumed at home. The remainder will be shipped to outside points.

"Most of the berries shipped away will go to Northern California, Oregon and Washington. A few probably will go to British Columbia. The Southern California growers have a great advantage over their northern competitors, as the berries mature much earlier here than they do in the northern part of the state and in Oregon and Washington. This gives the Southern California berries practically a clear field for one or two months.

"Many berries will be shipped to New Mexico and Arizona also. Some will go as far east as El Paso, Tex. About April 15 they will begin to arrive freely.

"The plants are looking fine and I have every reason to expect the quality will be excellent. The plants have been much benefited by the recent rains.

"This year, instead of shipping berries from the fields to Los Angeles and from here to outside points, we shall establish a station in the fields and ship direct from the fields to the North and East. Our shipping station will be in the Gardena-Moneta section. By experiment last year we found the latter method preferable."

PASSING OF SMALL FRUIT GROWER.

We can see a gradual sluffing off of the small fruit industry close in around Denver, and we mark the passing with a good deal of regret. Twenty-five years ago this neighborhood was resplendent with small patches of profitable fruits, and everybody pursued a happy course in bringing their crops into the perfection which hope dictated and the market bought at top prices. Then came the land boom of 1888, when owners became fidgety. Then speculators appeared on the scene, and the land was parceled out and sold to suburbanites and others with varying ideas. Those who continued the fruit business on these newly acquired lands found they could not make a profit, for the interest ate them up, and so they passed on. The rich suburbanites knew nothing about horticulture, and entrusted their grounds to hired help, with the inevitable result. The old-timers who remained in the business lost faith and became careless when the Dagoes moved in and set up fierce competition, so that things have been going from bad to worse until now not nearly so much small fruit is produced as twenty years ago to feed a population that has trebled in that time. All this means that the outside communities as far distant perhaps as a thousand miles are called upon to supply us, and every season the cry goes up from Macedonia that we have not enough fresh fruit to feed the hungry horde, and canned goods are not altogether inviting when we ought to be getting better things. This is a long story in a few lines.—Denver Field and Farm.

HOIST.

"I am sorry to be critical, my dear," said Mr. Lambkin, "but this pie is not the kind that mother used to make—not by a long shot."

"It's too bad, Henry," said Mrs. Lambkin, amiably. "I don't know what to do about it. Perhaps you'd better ring her up on the 'phone and tell her. She sent it over this afternoon."—Harper's Weekly.

Live Stock and Dairy

Dairymen and stockmen are requested to write of their experience. Mrs. Sherman is always willing to answer queries and this, with experience of other workers, will make this department of greater value.

SELECTION OF A PROFITABLE TYPE OF DAIRY COW.

By Prof. W. H. Pew, Iowa State College.

The breeds of milk-producing cows are numerous. All have excellent qualities, some excelling others in quality of milk produced, and some excelling in the percentage and total quantity of butter fat produced. The breed which the farmer selects must be the breed which he particularly favors and the one which is peculiarly adapted to the kind of market which he is intending to supply.

All of the special purpose breeds of dairy cows have been given public tests and have proved themselves to be economical producers when properly handled. Any one of the breeds of dairy cattle, as the Guernsey, Jersey, Holstein or Ayrshire, if adapted to the production of the market demands and if properly handled and cared for, will yield the owner a good profit.

The dairy cow, of whatever breed she may be, is a machine which economically converts roughages and concentrates into edible products, as milk and butter fat. It is the good fortune of the Iowa farmer to be able to raise large amounts of roughage and some kinds of grain feeds particularly adapted to the dairy cow. Hence, in selecting a dairy cow, it is best to bear in mind a few facts which are given below:

1. She must be able to consume large quantities of roughage, as well as be able to consume sufficient amounts of concentrated feed.
2. She must be a cow of strong constitution.
3. She must be persistent in her milk flow.
4. She must convert her feed into milk and butter fat, rather than use her feed for the production of body fat.
5. She must be a regular breeder.
6. She must be of a good disposition, and be of temperament to produce dairy products.
7. She must possess a well-developed mammary system.

The dairy cow must be able to consume large quantities of roughage, because the roughage is the cheapest part of the ration and raised very extensively in this state. In order to produce large quantities of milk, she must eat large quantities of food, or, in other words, be a good feeder. The large muzzle, head of proper proportions, great depth through the chest and large size of barrel are all indications of feeding capacity. The cow with the contracted muzle, the narrow face and head, the shallow chest and lack of "bread basket" is the cow that refuses to do her duty at the feed manger.

By constitution is indicated the power to withstand the severe strain of producing large quantities of milk as well as be able to produce offspring. In order to do these things, the cow must have proper heart girth or space in which the vital organs can perform their duties. The strong, vigorous cow with large nostrils, the clear and healthful appearing eye. the deep chest and large barrel, is the cow which conforms most closely to the cow of strong constitution. Cows weak in constitution have been found to be:

1. Light feeders.
2. Easily thrown off feed.
3. Not persistent milkers.
4. Not economical producers.

Persistency in milk flow is one of the qualities which make a profitable dairy cow. The cow that starts in at freshening time to produce thirty or forty pounds of milk daily and fails to continue this flow for more than a short time is not the persistent milker. To be profitable, it requires a cow to give a large flow of milk through her entire lactation period.

Beef cattle will convert the food they receive into body fat. The best type of dairy cow will convert her food into milk and butter fat, and will even rob her body of fat in order to supply the pail. The type of cow that lays on fat instead of producing heavily is the undesirable type of cow for dairy purposes.

Regularity of breeding is another one of the requirements of a dairy cow in order to insure the heaviest of milk production. Of course, farrow cows will be persistent in their milk flow, but they will not produce the maximum quantity.

Docility is another of the important requirements of a good dairy cow. Ugliness and irritability are not qualifications at all desirable.

The term "dairy temperament' is applied to dairy cattle, indicating strong vitality and recuperative ability, enabling the animal to maintain her productive powers. Such temperament is found in cows open in their skeleton framework, having much space between vertebrae of the back and between the ribs.

The mammary system is of utmost importance in considering the qualifications of a good dairy cow. The udder, the center of milk manufacture, ought to be large, well balanced as to quarters, extending well in rear and forward on the abdomen; the teats of good size and squarely placed on the corners of the udder. The udder must be well nourished with blood, which carries the nutrient portions of the digested food. This blood reaches the udder through the pelvic region, and is carried away by the milk veins which appear on the abdomen of the cow and enter the milk wells. Hence the size of milk veins and milk wells is indicative of the amount of blood that is passing away from the udder. The skin of the udder ought to be soft, and the udder itself ought to be pliable.

The typical dairy cow combines feeding capacity, great constitution and large milk production in a body of quality, full of nerves, and not disposed to lay on fat during the production period.

THE SWAPPERS.

Silas wasn't quite sure that Jedediah's old horse was quite up in value to his cow, and he demurred.

"Wa-all I dun'no,' Jed-diah," he said, scratching his head dubiously. "That there old caow o' mine hez her good pints."

"Sure she has, Si," returned Jedediah, "but I calculate ye gotta agree that a caow's to be jedged not by her pints, but by her quarts."—Harper's Weekly.

Trade In Your Old Separator

This year we shall continue to make an allowance in trade for old separators in exchange for the

United States Cream Separator

Thousands upon thousands of dairymen have taken advantage of our offer during the past year, and this year will probably see a great increase in the number of "exchanges."

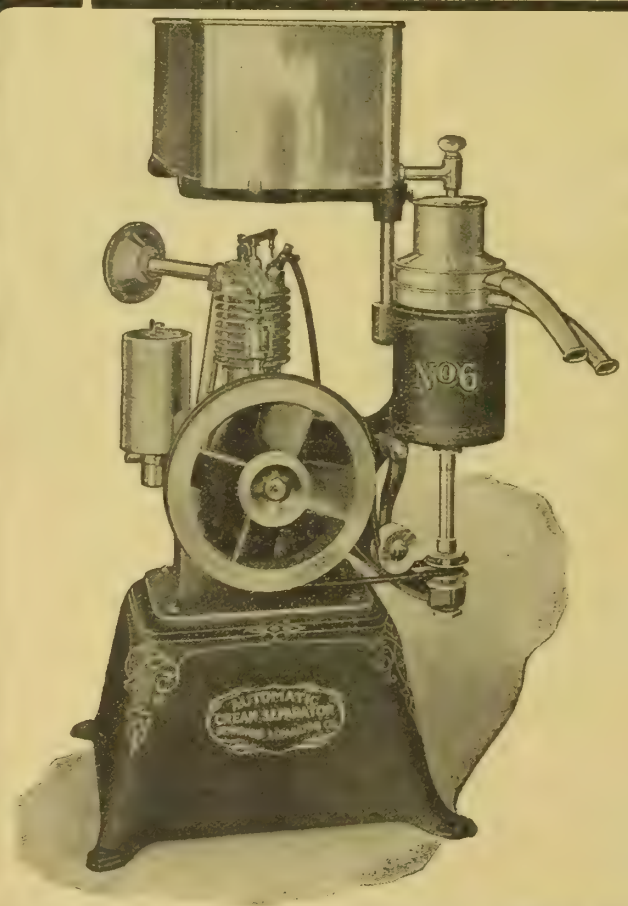
The old separators are of no use to us. They are sold for old metal to junkmen. But every United States which supplants an inferior, worn-out machine is another "silent" advertiser of the merits of the United States. That is why we shall be glad to make you a liberal allowance, so that you may know what the best separator is like—and tell your neighbors.

To owners of old models of the United States Cream Separator we make the same liberal offer. The old models, perfect skimmers, durable and still desirable in most respects, have been greatly improved upon in later models, especially in respect to easy running.

It will be money in your pocket to consult a U. S. agent immediately. If there is none near you, write to our home office, asking for Catalogue 20, and we shall attend to your wants.

The United States holds the World's Record for skimming, made in 50 consecutive tests, extending through 30 days, with the milk of 10 different breeds of cows. Also won the only Grand Prize at Seattle, 1909.

Vermont Farm Machine Co., Bellows Falls, Vermont, U. S. A.



THE AUTOMATIC SEPARATOR

THE 1911 SENSATION

At a glance you will appreciate the advantage of the "Automatic."

No more back breaking crank turning.

Simply start the engine, when you commence to milk and when through milking, turn off the switch and the work is done.

THE PERCHERON SOCIETY OF AMERICA.

Has just taken over all records and business of Percheron Registry Company of Columbus, Ohio. 215 breeders took membership in P. S. of A. during December and January alone. 137 more new members added thru recent acquirement named above. There is now but one recognized Society in the United States recording Percherons. For information address WAYNE DINSMORE, Secretary, Union Stock Yards, Chicago, Ill.

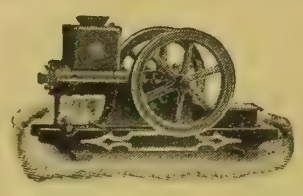
THE EMPIRE LINE



When you go out to buy a good cow, you are quite apt to ask about ancestry; now why not do the same when purchasing a cream separator? Why not enquire about its record; you would not expect to get a good cow from poor stock, and you cannot get a good separator made from poor stock. We wish every owner, or expected owner, of a Cream Separator could visit the Empire factory, and see the stock and material and skilled workmanship, in these machines. It surely would open your eyes and you would go back home and say to the good wife, "Well, they are worth the money, they are surely made upon honor, and will stand the test." Many a man has been immensely surprised in going through the Empire Factory to see the amount of work put into these machines—it's quality every time.

Empire Cream Separator Co., Ltd., 85 North 6th St., Portland, Ore.

PERCHERON SOCIETY OF AMERICA.

The most important move that has taken place in the history of record consolidations took place on February 9th, when an amicable arrangement was reached between the representatives of the Percheron Society of America and the representatives of the Percheron Registry Company.

By the terms of this agreement the Percheron Society of America has taken over all of the books and records of the Percheron Registry Co. and recognizes as pure bred the horses recorded by said Percheron Registry Company for which certificates have been issued, bearing the name of William Bell, president and Charles C. Glenn, secretary.

This move has long been recognized as desirable and will benefit every breeder of Percheron horses in America. While the number of animals recorded by the Percheron Registry Company is not considerable, amounting to but 4823 head all told, the fact that they have been recorded by a separate company has worked hardship to many breeders.

A most valuable publication of the society has just been issued in the Percheron Stud Book, Volume 12. It is in two parts, Number One listing stallions and Number Two, mares. These books contain pedigrees from 55,000 to 59,010, inclusive, and a number of other pedigrees hitherto unpublished. Part One contains proceedings of the annual meetings of '09 and '10, also complete constitution and by-laws. The books may be had at $5.00 by non-members, $3.00 by members. Former issues may also be had at same price. The growth in membership has been extraordinary, and with the absorption of the Percheron Registry Company, great solidity and popularity will be given. Any one desiring information regarding the organization should address Wayne Dinsmore, secretary Percheron Society of America, Union Stock Yards, Chicago.

FERRETS ON FARMS.

Every year thousands of bushels of grain are destroyed by rats and many fruit trees are ruined by rabbits.

For destroying the rats poison cannot be relied upon, and it is dangerous to use. Cats and traps will only catch a few of the unsuspecting ones. The gun and dog are of no use when the rabbit is driven into its burrow.

The value of the ferret for exterminating these pests is not appreciated by the majority of farmers. With the ferret there is no getting away. It will drive rats and rabbits and other small animals from all manner of hiding places. Being small in size and shape, it will go wherever a small rat will.

Ferrets are natural hunters and need little training. They are bloodthirsty and fearless, and follow by scent. Nearly all animals are in deadly fear of them and will make their escape if possible. A rat will not fight a ferret unless cornered, and then is sure to get the worst of it.

They are of two colors—white and brown. There is no difference in breeding and working, only a fancy as to color. The male is a little larger than the female and will stand more hard work. For hunting rabbits one is all that is necessary. For rats under barns or large buildings, several give best results. They are hardy animals and with proper feed and care will do well in any climate.

The best feed for them is bread and

Anthrax Cure, Milk Fever Outfits. See O. J. Weber Co., 225-227-229-231 East Sixth Street, Los Angeles.

milk and fresh meat. A mash made from whole wheat flour is good, if fed carefully.

Every barn should have its pen of ferrets, and then when a rat shows up go after it.—The Smallholder, London.

DELAINE MERINO.

An interested reader wants to know what kind of a sheep the Delaine Merino is, and if it is very good as a producer of mutton.

Delaine comes from two words, "de," meaning from, and "laine," wool, or woolen. In the trade the term means a fine grade of wool used in making fine untwilled dress goods. In a more common application the term means the finer grades of wool produced. The Delaine Merino is one of the breeds which produce the very best wool on the market.

The standard of excellence calls for a sheep having a deep, round, wide and long body, showing a mutton capacity, carrying heavy thick flesh, the top and under lines being straight and the skin smooth, pink and well filled out. The head may have small horns, however, the present tendency is toward the polled variety. The nose and the legs are well covered with wool to the very toes. The fleece is from three to five inches long and a full-grown ram may yield as high as 25 pounds of wool at a shearing. Ewes yield as high as 15 pounds of unwashed wool.

The breed is fair for mutton. The wethers mature reasonably early. They do not dress quite as much as the true mutton type, but the quality is good and always sells well on the market.—Coleman's Rural.

SCIENCE OR IGNORANCE.

The finest intellects of the land consider at once that the farm cannot be understood for its own preservation and our best profit, unless the farmer calls to his aid the investigations of science. To deal with the forces of nature wisely and well, we must know something of what men of science have learned. That is a plain, common sense view of the case. If this view of farming be true, compare it and what it teaches with the ideas and beliefs of the farmer who is ignorant of what science teaches. How widely apart are the ends of the two roads. What has ignorant farming done? It has destroyed a large portion of the once abundant fertility of a wide area of this country. That was done by men who despised the teachings of science—what they called "book farming." Has science ever done so destructive a work? Has science ever bred for the production of scrub cattle? Science is not faced that way. And yet, with all this dark record before them, there are farmers today, even in our own midst, who try to bolster each other up in opposing what may be called scientific farming. The bottom principles of such farming is to so manage first and foremost for the upbuilding and preservation of fertility. Scientific farming says there is no real profit in any other kind of management. Science says you will not lose if you put your faith in right principles. Science says it is a good investment always to store up a surplus of fertility in your land.

But ignorance pursues another path. It says, farm first and always for the present dollar. Put your faith in the dollar that is in sight. Live for today; tomorrow you may die. Don't spend any money on the buying of knowledge. Don't buy fertilizers. Don't lend any money to the farm. Skin the farm and lend what surplus money you may get on a mortgage that covers some other badly skinned farm.

In the course of events the farmers of this country have come to a parting of the ways. The question before the house is, which will we follow, the teachings of science or ignorance? Which has the better record to recommend it?—Hoard's Dairyman.

Veterinary

Answers in this column by Dr. Fred G. Matthews, are without charge. For immediate mail answer remit $1.00. In writing questions give full symptoms or particulars of injury of animal.

Heaves—Cough.

My horse, which has the heaves, lightly has coughed all winter. There is an occasional discharge from the nose. I feed alfalfa hay, but changed to oat hay without noticeable improvement.—Subscriber, Chino.

Your horse will do better if fed more grain and less hay. Reduce the bulk of the food consumed. The grain should be oats if not too expensive. Give one drachm nux vomica, half drachm bella donna and one drachm chlorate of potash twice daily in the feed. Also give one tablespoonful of Fowler's solution twice daily mixed in the grain. (Measure the dose of Fowler's solution in a medicine glass). Continue treatment two weeks then skip ten days if it is desired to repeat the course.

Indigestion.

My mare, 4½ years old, has "lampers." She is fed oat hay and grain morning and evening and allowed to run on pasture during the day. I gave her corn on the cob and she ate the cobs with the grain. I often notice her eating earth. I examined her manure for worms and gave a course of worm powders. I do not like burning or cutting the "lampers." What does she need?—Subscriber, Occidental.

At the age indicated the corner front teeth of the horse are replaced by permanent teeth and as a consequence the gums may be inflamed. You were correct in not cutting or burning the gums as the practice is cruel and not beneficial. The grinders are often irregular at this age due to the fact that some teeth are not developed and others are just appearing. This condition of the teeth is often accompanied by unthriftiness which allows worms to infest the animal. Drench the horse with two ounces of turpentine in a quart of sweet oil and on the third day following drench again with one pound of epsom salts in a quart of water. Always give drenches carefully and through the mouth, never drench through the nose. After the drench has operated secure one pound of hyposulphide of soda and give one tablespoonful in the feed three times a day.

Each one of us is bound to make the little circle in which he lives better and happier. Each of us is bound to see that out of that small circle the widest good may flow. Each of us may have fixed in his mind the thought that out of a single household may flow influences that shall stimulate the whole commonwealth and the whole civilized world.

The truest self-respect is not to think of self.—Beecher.

Do your cows milk hard? Send 50 cents for teat expander. O. J. Weber Co., 225-227-229-231 East Sixth St., Los Angeles.

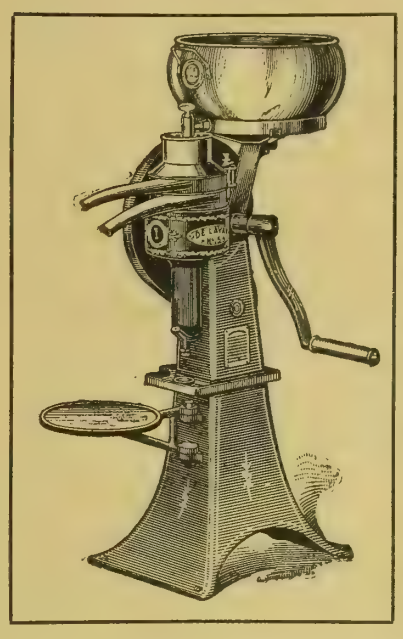
98% of the World's Creameries Use

DE LAVAL

CREAM SEPARATORS

Ten years ago there were a dozen different makes of creamery or factory separators in use. Today over 98 per cent. of the world's creameries use DE LAVAL separators exclusively.

It means a difference of several thousand dollars a year whether a DE LAVAL or some other make of separator is used in a creamery.



Exactly the same differences exist, on a smaller scale, in the use of farm separators. Owing to the fact, however, that most farm users do not keep as accurate records as the creameryman, they do not appreciate just what the difference between a good and a poor separator means to them in dollars and cents. Nine times out of ten the farmer can't tell whether or not he is wasting $50 to $100 a year in quantity and quality of product through the use of an inferior cream separator.

If you were in need of legal advice, you would go to a lawyer. If you were sick you would consult a doctor. If you had the toothache you would see a dentist. Why? Because these men are all specialists in their lines, and you rely upon their judgment and skill. When it comes to buying a separator why not profit by the experience of the creameryman? His experience qualifies him to advise you correctly. He knows which separator will give you the best service and be the most economical for you to buy. That's why 98 per cent. of the world's creameries use the DE LAVAL exclusively.

There can be no better recommendation for the DE LAVAL cream separator than the fact that the men who make the separation of milk a business use the DE LAVAL to the practical exclusion of all other makes.

CONTENTS THIS WEEK

A DREAM THAT CAME TRUE; Cover.
DEDICATION OF WORLD'S GREATEST DAM; 355.
CITRUS AND TROPICAL FRUITS.—Grapefruit in Southern California; Chlorosis Again; 356, 357.
DECIDUOUS BUSH-TREE FRUITS.—Spray for Codling Moth; 358, 360.
HOME GROUNDS BEAUTIFUL.—Nurse Plant Methods of Propagation; Natural Vegetation an Indicator; 361.
GARDEN AND FIELD CROPS.—Making the Home Pay; Berry Production; Passing of Small Fruit Grower; 632.
LIVE STOCK AND DAIRY.—Selection of a Profitable Type of Dairy Cow; Percheron Society of America; Ferrets on Farms; Delanie Merino; Science of Ignorance; 363, 364, 365.
VETERINARY.—Heaves; Indigestion; 365.
EDITORIAL.—G. H. A. Goodwin; Team Work; Notes; 366.
AGRICULTURAL NEWS NOTES OF THE PACIFIC COAST.—Northern, Central, Southern, The Coast; 367.
POULTRY.—Raising Chicken by Natural Processes; Incubator Room; Unsanitary Conditions Invite Roup; Some Signs of Good Layer; 370, 371.
QUESTIONS AND ANSWERS.—Blood Meal; Fertilizing Walnuts; Acetylene Gas Residue; Bermuda Eradication; Oranges Between; Cherries; Spraying Apples; Planting Pumpkins, Wild Morning Glory; Twigs Dying; Apples Planted After Peaches; Arizona Oranges; Candying Citron; Blasting Hardpan; Curing Calfskin; Tents for Frost Protection; Curing Meats; Feeding Barley; 370, 372, 373, 374, 375.
LEGAL.—Acquiring Right to Ditch; Trespassing Sheep; 375.
TIMELY RANCH SUGGESTIONS.—Keep an Automobile; Why Not the Grange in Southern California; 376, 377.
BEES AND THEIR CARE.—Queens and Queen Rearing; 379.
GENERAL HOUSEHOLD NOTES.—A Thought for Each Day; Man Without a Country; Easter Hams; 380, 381.
PRODUCE MARKET.—Los Angeles Market; San Francisco Market; Citrus Market; 382, 383.

The quantity of barley on farms in the United States on March 1, 1911, was about 31,000,000 bushels, or 19 per cent of the 1910 crop.

The exports of farm products in February this year were far in advance of last year. The bureau of statistics reports 10,750,000 bushels of corn exported in that month as against 4,500,000 in February of last year.

The governor has signed the Benedict bill providing for county free libraries. This will open up possibilities of education and pleasure to people in all parts of the state. We hope the counties will take hold of the plan and make it a success.

The United States does not produce sufficient sugar for its own needs, and last year imported 4,250,000,000 pounds valued at $114,000,000. If more of California's counties would come up to the record of little Orange county, with its four sugar factories, we might produce our own sweets.

Prof. Shaw's bulletin on How to Increase Yield of Wheat in California should be in the hands of every wheat grower in the state. It is Bulletin 211 and a post card will secure it from the Agricultural Experiment Station, Berkeley. Prof. Shaw has developed some remarkable results with newly introduced varieties.

The total number of farms operated in the state of Kansas in 1910 by owners was 110,742 as against 110,443 in 1900. One thing noted, which is rather peculiar, is that the number of small holdings has decreased during the decade and the number of large farms has increased. The number of mortgaged farms has materially decreased.

The flax industry of North Dakota is threatened with extermination on account of diseases and difficulties now affecting the crop. The department of botany of the North Dakota agricultural college is taking up investigation of special methods of handling seed and soil and hopes to save the industry. Effort is now being made to secure seed free from disease to be distributed to farmers.

That old line farm paper, the Country Gentleman of Albany, New York, maintained for years exactly as it was founded, and considered one of the standby papers of the nation, has been sold by its present management and is now the property of the Curtis Publishing Company of Philadelphia. The news must have come with a shock to its old-time friends, for if the Curtis Publishing Company puts the same amount of ginger into this publication that it has into others it has purchased, the Country Gentleman will be a vastly changed paper.

In connection with the work of the University Farm School, the Cultivator has found it necessary to refer to moral conditions in the little town of Davis to which many young boys are sent for better education in farming. Small as the town is, it has had a surplus of saloons which did not tend to give an uplift to the youngsters living there. The people themselves refused to remove these temptations from the boys and now the state legislature has acted, drawing a line three miles from the farm within which no saloon may exist. The bill passed both houses, and it is probable that before this item is read Governor Johnson will have signed it.

It is yet a little early to begin to talk about fire protection, for between now and the actual danger time most people will forget it. The Cultivator will refer to it many times before then, and we now take time by the forelock and suggest that a campaign of education be started in every Farmers Club and Grange and Farmers Union, or other assemblage where people may be gathered, to impress the necessity for greater care with camp fires, matches and pipes. Probably one of the greatest dangers is the leaving of camp fires. Every known case of carelessness by camper or hunter should be reported to the proper authorities and severe punishment meted out.

Fruit growers and handlers are somewhat concerned over the new law prescribing eight hours per day for working women. Of course there is a provision in the law by which in time of rapid ripening of fruit and danger of loss these hours may be exceeded, yet it is felt the regulation will complicate the situation and make more expensive the handling of fruits. We hope this will not prove to be the case and that the eight-hour day will be sufficient. It has been insisted that if this law stands the gates must be opened to the Japs. We do not think this is the general feeling. If our own people are assured of permanent work, there will be plenty of Americans to handle the fruit of the state.

The Cultivator has often remarked that staples, and well proven varieties at that, are generally more profitable than the new or fancy. The paper-shelled almond has been considered far superior to the hard-shell, but investigations by Mr. Anderson, Secretary of the Yolo County Almond Growers Association, and Mr. Brown, of the horticultural department of the state farm, have led these gentlemen to conclude that the hardier varieties are more profitable than the paper-shells. They are "surer and heavier bearers to an extent that more than offsets higher prices accorded the choicer varieties." These nuts have proven exceptionally profitable during the past year.

The annual convention of the California Association of Mutual Fire Insurance Companies recently held in Tulare should give new impetus to this economical means of handling fire insurance of farm buildings. Under the state laws such an association cannot operate outside of the county in which it was formed, therefore separate organizations are necessary in each county, but each county can furnish competent men to handle this business. In nearly every instance in this state this association has been able to give insurance at much less cost than the old line companies. The officers for the coming year are: A. Sorrenson of Fresno, president; J. D. Musgrove of Yolo, vice-president; Geo. F. Cromer of Los Angeles, secretary and treasurer.

The Boston Work Horse Parade Association has inaugurated a novel and effective way of securing more humane treatment of city work horses, and incidentally more actual service for the owners, by a system of stable inspection. The association offers to inspect free of cost any stable entered for the purpose. The inspector visits and observes details of feeding, grooming, blanketing, etc., and confidentially reports to the stable proprietor. Defects of his management are pointed out and suggestions made. The inspections are made two or three times a year, and on the annual parade day silver medals and prizes are awarded to owners, foremen and workmen for best condition and treatment of horses.

G. H. A. GOODWIN.

Many of the older readers of The Cultivator will remember the work of G. H. A. Goodwin, for years its editor and proprietor, so closely identified with its early history that he is regarded as its founder. It is with regret that we chronicle Mr. Goodwin's death at his home, 175 Crown avenue, Hollywood, March 16th. He was yet a young man, not having reached his fiftieth birthday, one of those indefatigable workers who wear their lives out before their time. Funeral services were held March 18th at his home.

In 1889 Poultry in Southern California was first published by W. B. Nesbit and conducted by him until 1890 when it was purchased by Mr. Goodwin. At that time the paper had practically no circulation. We have heard Mr. Goodwin say that the entire office force from devil to editor was constituted of himself and his wife who helped out on mailing days when the "office force" was overrushed. Mr. Goodwin owned the paper alone until November, 1891, when Mr. W. B. Thomas became associated with him and a few months later the name of the paper was changed to the California Cultivator and Poultry Keeper. It was then a little nine by twelve monthly. In 1898 the partnership was dissolved, Mr. Thomas on account of his health going to the Hawaiian Islands where he is still raising pineapples. The circulation of the paper at this time was 4200. On January 1st, 1900, Mr. Goodwin began publishing the weekly Cultivator, remaining editor and manager until 1903 when he gave up newspaper business and engaged in buying and selling real estate.

LAND AND PRODUCTS EXPOSITION.

The first land exposition on the Pacific Coast was opened last Saturday in Shrine Auditorium in the city of Los Angeles. There were thousands of people filling the aisles of the great building and expressing wonder at the exhibits which had been gathered together in the few weeks of preparation. The exposition is primarily intended as an exhibition of California's lands and their products, but incidentally there are many exhibits of manufactures which hinge more or less remotely on agriculture. Those who have to do with sub-division of large tracts of land are making the best exhibits, though perhaps the most striking of all is that of a large nursery which shows plants from all parts of the world. Communities, counties, and even states, make extensive exhibits. Arizona is on hand with a magnificent showing made up largely of products of the Salt River valley. All told, it is a great show. It will be on during this week and next.

We are indebted to Mr. C. T. Hirst of Phoenix for photo from which engraving on front page is made.

Practically all of the hop crop has been disposed of by the producers.

The farmers packing house at Geyserville, Sonoma county, was destroyed by fire with a loss of $5000.

Agricultural News Notes of the Pacific Coast

Northern California

A $30,000 precooling plant will be built at Lodi.

Yolo county has planted 15,000 almond trees this season.

Petaluma flour is being shipped to Manila, Philippine Islands.

Two hundred elk are wintering in the lava beds of Siskiyou county.

Russian Valley farmers will plant over 200 acres of tomatoes this season.

Haywards, Alameda county, reports a rainfall of almost 29 inches for the season.

The "Eggs by the Pound" bill has been voted down in the state assembly.

The Farmers Union at Gold Hill is discussing building a co-operative cannery.

Oroville, Butte county, has definitely settled on November for its citrus fair date.

Shasta county has planted 10,000 grapevines in the Cottonwood section this season.

Yolo county never had as many reclamation projects under way as at the present time.

Canners are offering $7.00 per ton for tomatoes to be grown at Healdsburg, Sonoma county.

Sonoma county hop growers have disposed of all their hops excepting about 400 bales.

The pure food and industrial exposition at Petaluma opened Saturday and will continue until April 3rd.

A meeting of the state good roads association has been called for the last of the month at Sacramento.

The California Development Board is encouraging the movement to improve the quality of malt barley grown in this state.

Farmers having property in Amador, Calaveras and Sacramento counties met recently at Ione and formed an anti-debris association.

The three-mile dead line for saloons around the state farm at Davis has been established by enactment of both assembly and senate.

The senate has passed an automobile bill which will bring $800,000 of annual revenue into the state treasury to aid in the good roads fund.

Chico Farmers Union has received five gold medals, two blue ribbons and a gold cup for exhibits from the National Horticultural Exhibit at Council Bluffs.

The senate has passed the Gates fence bill, or rather amendment to the former bill, which makes it obligatory on stock owners to fence in their own stock.

Representative Kent is given credit for bringing about the abandonment of the Lake Tanoe contract which would have taken its waters into the state of Nevada.

The press reports that Prof. Babcock of the State University is testing out specimens of hardy Navel orange trees of a new variety furnished by the department at Washington.

The Shasta Power Co. has been sued by farmers of Sixty Hat creek for $255,000 for damages because of unlawfully taking 3500 inches of water which the farmers maintain is theirs.

Central California

There are 27 distilleries in Fresno county and 24 wineries.

Vineyardists feel that the recent rains give assurance of big crop.

Much damage to peach trees is reported from Fowler and Del Rey sections, caused by recent storms.

The prune orchards of Santa Clara Valley will soon be in full bloom and blossom festivals will be in order.

The destruction of many bridges and some farming land in Monterey county will cause a big rebuilding and repair expense.

The first step toward the 1911 Apple Annual of Watsonville was the holding of a meeting for preliminary arrangements last week.

On April 19th certain lands of Stanislaus, Merced and Mariposa counties, approximating about 36,000 acres, will be thrown open to entry.

The bill by the state legislature relating to the breeding of pheasants was passed. It is thought their increase will be much greater.

G. M. Homans, state forester, has made certain changes in California Redwood Park, amongst which is the discharge of the former warden and the foreman.

Some farmers along Gabilan creek in Monterey county go out with their pitchforks and fork in a number of carp which are caught in pools on overflowed land.

At a meeting of the West Side Irrigation District, recently in Madera, a committee was appointed to confer with government surveyors regarding difficulties of the work.

Representatives of 2000 colonies of bees met in county bee keepers meeting in Dinuba, Tulare county, last week. Suggestions were made for the formation of a San Joaquin Valley association.

With the forces of the U. S. government, of the state of California, and of various counties of the state, united in warfare against the poor little ground squirrel, life should soon cease to be a burden for the grain and fruit man.

It is reported that the manufacturing and larger fruit interests are combining to make a fight on the law prescribing eight hours as the legal day for working women, and it is announced that it may be declared unconstitutional.

The county superintendent of schools of Santa Clara county is urging the extension of agricultural teaching in the public schools and says: "The study of agriculture in high schools I consider one of the most important changes."

Dr. Rupert Blue of the Hospital Marine Service is making a strenuous campaign before various boards of supervisors to secure county cooperation. At the recent meeting with the supervisors of Kings county the board appointed an inspector for that county.

The Fresno Republican prize for the best suggestion for Raisin Day feature was won by Miss Mattie M. Webb, of Reedley, Fresno county. Miss Webb suggested as an excellent advertising feature that the public schools of the country inaugurate a raisin essay contest.

Southern California

El Cajon, San Diego county, reports strong movement of small ranch lands.

The spring floods of the Colorado are arriving much earlier than anticipated.

The capacity of the Anaheim sugar factory has been increased to 750 tons per day.

Orange county produced last year over 210,000 sacks of beans valued at $622,000.

One poultryman at Riverside has a 5400 hatch of White Leghorn chicks coming off.

The Land and Products Exposition in Los Angeles opens on Saturday of this week.

Fruit men of Villa Park, Orange county, will build a fruit storing and packing house.

Escondido has found it necessary to import many fruit trees for this season's planting.

Nearly every big bridge over the San Gabriel river was washed out during the last flood.

A new dairy farm entirely stocked with registered Jerseys was established at Imperial.

A 5,000,000 gallon reservoir has just been completed on the Yorba Linda orange lands near Fullerton.

Redlands is discussing the advisability of making an exhibit of her citrus fruits at some point in Canada.

Residents of the desert in Northern San Bernardino county are appealing for a share in the state good roads fund.

A meeting is being planned of boards of supervisors of the various counties to discuss good roads over Southern California.

The La Habra Walnut Growers Association received for its output last year $70,000 which is the record income of that association.

Last week was probably the biggest orange shipping week California ever saw; some days the shipments reached nearly the 400-car mark.

Cucamonga has formed a co-operative fumigation and supply company which is being encouraged by the horticultural inspector of that section.

Levi P. Chubbock, connected with the Department of Agriculture of the Division of Farm Management for the West, is investigating methods of citrus growers of Southern California.

Covina fruit growers are much concerned over the question of chemical and mechanical soil conditions. Experts are drawn on to give lectures before the Farmers Club and other gatherings.

On Wednesday, the 15th, the Santa Fe railway billed out of San Bernardino 200 cars of oranges; on the same date the Southern Pacific billed out of Colton 173 cars. These were the greatest daily shipments ever made over these roads, and would give an orange apiece to 25,000,000 easterners.

An enthusiastic Florida friend of a Riverside man sent him a box of the finest Indian River oranges on which he prepaid expressage of $6.40. They arrived all right but County Horticultural Commissioner Cundiff was unkind and discourteous enough to give the box a bath of coal oil and fire it before it was ever opened.

The Coast

Utah produced 7,000,000 bushels of wheat during 1910.

Fancy hogs are now quoted at Portland, Oregon, at $9.00.

Spokane's first Swiss goat dairy has just been established with imported goats.

Stock growers at Grangeville, Idaho, shipped 800 cars of fat stock during 1910.

The Oregon Agricultural College is giving for the first time a systematic course in apiculture.

The first annual Pacific Northwest Live Stock Show will be held at Portland, Oregon, March 20x22.

The fruit men of the entire Northwest are endeavoring to form a fruit exchange or selling agency.

Farmers near Dear Lodge, Montana, have failed in their fight against the Anaconda Smelter Company.

The first of the month gave heavy falls of rain and light snow over Spokane and Eastern Washington.

An artesian well was recently struck at Benson, Arizona, in a section where it was not known any water could be secured.

The farmers demonstration train visited 150 points in Utah and Nevada and entertained at its lectures over 40,000 people.

There are 3,800,000 bushels of wheat still in the hands of producers of Washington; this is about 26 per cent of the total output.

A large force is working on the Wahluke irrigation project seven miles above White Bluffs, Washington; 20,000 acres will be reclaimed.

The floods have caused much trouble along the Colorado and tributary rivers; part of the dam in Bee river, Arizona, has been washed out.

The supervisor of national forests at Provo, Utah, recently received bids for pasturing 9000 acres of national forest. The highest bid was for $1040.

At the Agricultural Fair held at Zamboanga, P. I., a two-hour hemp-stripping contest was one of the principal features, and many machines were in the contest.

The Hanford, Washington, Irrigation and Power Company will complete its canals and cement work in time for the present irrigation season which opens on April 1st.

Sheepmen of Montana have found excellent results in keeping corn. They only feed one-fifth of a pound per sheep per day but it is reported to add much to the thrift of the sheep.

From estimates of the Western Pine Manufacturers Association there is sufficient available timber standing in the Inland Empire of Eastern Washington to construct 17,000,000 cottages.

Settlers of the highlands in the Locke district near White Bluffs, Washington, recently held a mass meeting to inaugurate a movement to secure water for aproximately 75,000 acres.

The Pacific Homestead says that the dairy industry of Oregon within the past four years has not been so progressive as it should be. In 1907 the total value of dairy products was $17,000,000, since which time the value has materially declined.

"SUCCESS" Brooders

THE WORLD'S GREATEST CHICK RAISER

THE HOME OF MILLIONS

Big Claims and What You Get.

These days it seems that the man that does the most business and has the most money is the one that can exaggerate the most. On every hand when you get ready to buy an incubator you will get catalogues, circulars, letters, recommendations, cards and all kinds of promises, guarantees and assurances of 100 per cent hatches every time. I have been among the incubator companies a long time and have hatched thousands and thousands of eggs, and you take my advice and look out for the chaps that advertise a guarantee of 95 per cent hatches, or to hatch every fertile egg. Any poultryman of experience knows better. I don't promise anything of that kind; I do KNOW that you can get good hatches every time if you use good eggs. It depends entirely on the eggs more than any one thing.

This picture gives you a clear idea of how the "Success" Outdoor Fireless Brooder looks when in use. When we took the picture we had 180 Barred Rock chicks in the brooder and the yard. There were so many that the artist tried to retouch them on the photo to make them show plainly and he nearly spoiled the whole lot. Artists have peculiar ideas as to what a baby chick looks like.

The brooder as shown here is made from kiln dried redwood lumber. Walls are double, roof is made slanting and is water tight. The box holds 150 chicks to three weeks of age, and 75 chicks to six weeks of age. After chicks are three weeks old you can place them in other boxes and they will grow right along. We furnish the YARD FREE with every brooder. It comes packed inside the brooder and makes a nice yard for the chicks to be kept in.

This is the heaviest fireless brooder made and is the lowest in price, considering the capacity of the same.

Most companies ask from $10 to $12 for the outdoor fireless brooders. Our prices on all brooders and all incubators are from $5 to $15 less than other companies ask. We make incubators and brooders in connection with our other business. We sell on the smallest profit of any company.

Price only $6.50. We pay freight.

150 Outdoor Style $6.50 Prepaid

We Make Indoor and Outdoor Styles.

Outdoor Lampless System.

"Success" Outdoor Lampless Brooders will successfully brood and care for chicks in any kind of weather without the assistance of a lamp or other artificial heat. Whether it rains, snows or blows, the chicks are just as comfortable—yes, even more so, than under a hen.

The advantage of a Lampless Brooder cannot be overestimated, insofar that there is no lamp to fill and watch, no lamp to be accidentally blown out, and no possible chance of the brooder getting too hot or too cold.

The construction of this brooder is such that 150 chicks can be placed therein immediately when taken from the incubator and kept there in perfect comfort.

If you will take my advice on the fireless brooders you will use the 150 size, as by putting at least 75 chicks or more you will have better luck, I honestly believe, than with a small 75-chick brooder. The reason for this is that 100 or 150 chicks will keep warmer than 75 chicks.

Experience will teach you that for the first few days to keep the brooder in some enclosure to help protect the chicks from the cold early mornings. In the day time the brooder can be picked up and carried into the sun easily. I honestly believe that all heated brooders made by all incubator and brooder companies will be done away with in the next two years. We make as good a brooder heated by lamps as can be made. It will not raise any more chicks than the fireless brooder, and takes more time to manage it. There is NO DANGER OF FIRE, no lamp to bother with, no oil expense, and you will save more and better chicks than any other way you can brood them. You may be skeptical and afraid to try a fireless brooder, but I will sell you one on trial. If it don't do the work as I say it will, send it back and get every cent. I know absolutely that you will raise the chicks if they are reasonably strong to start with. No brooder on earth will raise weaklings from pullets' eggs. Be sure you get good eggs to start with, and then you will know that your chicks will be good when you get them.

With ordinary care and following my simple directions in regard to feed, etc., you will raise 90 to 95 per cent of every lot of chicks you put in the brooder. Try one at my expense. If they don't do the work I will refund every cent. I sell my incubators the same way.

BUY AT WHOLESALE

When you buy here you pay no agent's profits. I sell a $20 incubator at $14. If you buy of any agent you pay him several dollars more than the incubator or brooder is worth, that's HIS profits. We sell direct to you from the factory—no agent's profits to pay at our low prices. Investigation is all I ask.

GUARANTEE

I guarantee the Success Incubator and Brooder to be exactly as represented in our catalogue. When good, fresh, fertile eggs are used, I guarantee a satisfactory hatch if you follow my simple instructions.

We agree to replace any defective parts on the incubator or brooder if delivered to us, free, any time within one year from date of sale.

Practical Poultry Culture

RAISING CHICKENS BY NATURAL PROCESSES.

While even the small grower of chickens in many cases uses an incubator for hatching, circumstances sometimes make it necessary to hatch and raise chickens by aid of the mother hen. To persons so situated an outline of the method practiced at the station before incubators had reached their present development may be helpful. An unused tie-up in a barn was taken for the incubating room and a platform was made along the inner side. The platform was 3 feet above the floor and was 2½ feet wide and 50 feet long. It was divided into fifty little stalls or nests, each 1 foot wide, 2 feet long, and 1 foot high. This left a 6-inch walk along the front of the nests for the hens to light on when flying up from the floor. Each nest had a door made of laths at the front, so as to give ventilation. The door was hinged at the bottom and turned outward. Across the center of each nest a low partition was placed, so that the nesting material would be kept in the back end—the nest proper. For early spring work paper was put in the bottom of the nest, then an inch or two of dry earth, and on that the nest, made of soft hay.

Whenever half a dozen hens became broody they were taken in from the hen house and put on the nests, each nest having a dummy egg in it; the covers were then shut up, and nearly every hen seemed contented. In a day or two 13 eggs were placed under each hen. Every morning the hens were liberated as soon as it was light, when they would come down of their own accord and burrow in the dry dust on the floor, eat, drink and exercise, and in twelve or fifteen minutes they would nearly all go onto the nests voluntarily. In the afternoons one would occasionally be found off the eggs looking out through the slatted door. If she persisted in coming off she was exchanged for a better sitter. The double nest is necessary, otherwise the discontented hen would have no room to stand up, except on her nest full of eggs, and she would very likely ruin them. There was no danger of this with the double nest, as she would step off the nest, go to the door and try to get out.

The advantages of a closed room in which to confine the sitters are many, as the hens are easily controlled and do not need watching as they do when selecting nests for themselves, or when sitting in the same room with laying hens. A room 12 feet square could be arranged so as easily to accommodate 50 sitters.

The most satisfactory arrangement used at the Maine station for the accommodation of the hen with her brood of young chicks consisted of a closed coop about 30 inches square, with a hinged roof and a movable floor in two parts, which would be lifted out each day for cleaning. This little coop had a wire-covered yard attached to it on the south side. The yard was 4 by 5 feet in size and 1½ feet high. Its frame was of 1-inch by 3-inch strips and was fastened securely to the coop.

The wire on the sides was of 1-inch mesh, but on top 2-inch mesh was sufficient. Such a coop is easily kept clean, and the coop and yard can be set over onto clean grass by one person.

The small run will be sufficient for the first few weeks, but soon the chicks need greater range, and then the fence at the farther end of the run can be lifted up 3 or 4 inches and they can pass in and out at will, while the mother will be secure at home and they will know where to find her when they get cold or damp or need brooding. Such a coop accommodates 15 to 20 chicks until they no longer require brooding, after which several flocks should be combined in one and put in a portable house on a grassy range.

Whenever the hen is allowed to hatch or to mother chicks, much care must be exercised to prevent lice from getting a foothold and ruining the birds. The free and frequent use of fresh insect powder upon the hen, working it through the feathers to the skin, is one of the best methods for destroying the pests. Grease or oil is effective when applied to the heads and under the wings of young chicks, but care must be taken not to get too much on them, especially during damp weather.—Bulletin 357, Maine Station.

THE INCUBATOR ROOM.

It is important that the incubator room be so situated that it can be kept at a fairly constant temperature. On this account an underground room is usually selected. For many weeks the well-lighted cellar under the wing of the farmhouse was used by the Maine station. A cold or badly ventilated cellar would, however, be poorly adapted for incubators. Ventilation is very important, and where several incubators are in use artificial ventilation must be provided, in order that the machines may be furnished with clean, fresh air at all times.

In 1905 the Maine station erected an incubator house which practically consists of a well-made, light, airy cellar with a house for the poultry man above it. The incubator room, which occupies the entire cellar, is 30 feet square. The room is 7 feet high in the clear, 5 feet of which is below the level of the outside ground. It is lighted by six 3-light windows, carrying glass 10 inches by 16 inches. The cement walls are finished smooth and the cement floor is slightly inclined toward the southeast corner where the intake of the drain is located. This enables the free use of water from hose in cleaning the room preparatory to starting the incubators. Two chimneys extend to the basement floor and contain ventilating flues that have no opening into the rooms above. Entrance to the room is through a covered outside cellar stairway leading into a shed at the rear of the building. The room now contains twelve 360-egg machines in addition to several of smaller capacity.

In the directions which accompany the hot-air incubators of the type used at the station it is stated that an artificial source of moisture is not needed in operating these incubators

Johnson Gets Only 7 Per Cent Profit on 100,000 Old Trustys

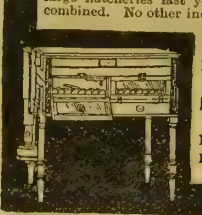
Incubators and Brooders

The evidence is conclusive that the PETALUMA is the best Incubator buy that can be made. The best value for the money ever offered and is appreciated most by those who have had varied experiences with other incubators. Why? Because it hatches such large, strong vigorous chicks. More Petaluma Incubators were installed in the large hatcheries last year than all other makes combined. No other incubator in the world has a hatching record to equal the Petaluma.



Write for our Free Catalogue. It is interesting.

PASADENA, CALIFORNIA.

except in very arid parts of the country. It is said that in other places the normal moisture of the atmosphere is sufficient to insure the necessary moisture in the incubator. The experience of the station indicates that except in a rather wet season if no artificial moisture is supplied to the incubators there is too great an evaporation from the eggs. It is demonstrable that many eggs fail to hatch because of this dryness of the air in the incubator. It is not desirable here to enter into a detailed discussion regarding experiments on this point. It suffices to state the fact that in the nation's experience better hatches have been obtained when moisture beyond that normal in the atmosphere is supplied during incubation. The most satisfactory way to supply this extra moisture has been found to be by wetting the cement floor of the incubator cellar thoroughly two or three times a day, depending on the degree to which evaporation is taking place. During the hatching season the aim is to keep the floor of the incubator cellar moist at all times.—Bul. 357, Maine Station.

UNSANITARY CONDITIONS INVITE ROUP.

A correspondent of the Spokesman-Review asks: What is the matter with my chickens. About a week ago I noticed that one of the hens had her left eye shut, a white circle being under it, the head very hot, a swelling on the sore side a little down and forward toward the butt of the bill. The hen is drowsy and refuses to eat. I washed it several times with diluted peroxide. Since I noticed the first case they have become afflicted at the rate of one very day. I now have the sick ones in a place by themselves.

In the first stage they are droopy and drowsy, refusing to eat; in the second, the left eye usually closes, there is swelling, fever being present, a slight swelling appearing toward the butt of the bill; third, a total indifference to everything. They stand or lie about, and white spots appear under the eye. I have observed that death usually occurs about this time. This fall I walled in the chicken house about a foot thick, covering it also with manure. It is quite comfortable. There is no ventilation, save at the top and bottom of the door. Should there be a vent in the roof? The hens are just starting to lay. I feed hot bran mash in the morning, with a little red pepper, and all the wheat they will eat about 4:40 p. m. There are 50 in the house, which is 15x12x7 feet.

The following is the editor's reply: "There is no question but that the chickens are afflicted with quite a serious case of roup. The plan of separating the well ones from the sick ones is commendable, and the treatment perhaps could be improved upon by the use of coal oil, which often will affect a cure in its earlier stages. Those that do not readily recover from several treatments will generally linger along for some time and spread the disease among the well birds. The better way is to dispose of all such in some way.

"From the description of her laying house I feel very sure that the cause of this trouble with her fowls is traceable to an unsanitary condition of her hen house. She admits that the ventilation is poor, and from her description sunlight can not get into the room, and in a room 15x12 feet in size, 50 fowls is altogether too many. There should be the best ventilation. The house should be thoroughly cleaned and made sanitary by the liberal use of lime and other disinfectants. The south side of the house should be converted into what is called an open front, using muslin curtains only, thus giving the rays of the sun access to the rooms and providing the best of ventilation. There are more flocks afflicted with roup throughout the Northwest than with all other diseases together, and it is nine times out of ten traceable to the tight rooms, poorly ventilated, no sunshine and dampness. With an open front we get rid of the dampness and it is a rare thing that we hear of poultry being afflicted with this disease when they are kept in open-front roosting rooms where there is no draft. Remember always that the three walls of the room aside from the front should be absolutely tight and that the open front house should be not less than 12 feet deep.

SOME SIGNS OF THE GOOD LAYER.

The head of a fowl will indicate much respecting its good or bad laying capabilities. The head of the good layer is long and slender, often too long for the breed it represents when judged by standard requirements. The eye set in such a head is bold, sparkling, full of life, and as keen and piercing as a hawks. The head is set on a neck clothed in a close-fitting hackle. The head of the drone is short and thick, and is furnished with an eye that is dull, lifeless, small and sunken in the head, and is set on a neck both thick and flabby, and is covered by loose hackles.

Any Mediterranean breed of fowl possessing a long, lean head will produce more eggs than one of its own breed possessing a thick, short head, and the same remarks apply equally to the Asiatic breeds and their allies. Another point that is indicative of the good layer is the lengthy back it possesses. I have never yet handled a short-backed fowl that could pay for enough salt to season its food.

We like the exhibition Wyandotte to be cobby and as short in the back as possible, but the utility Wyandotte is quite a different type of bird. Her back is too long for standard requirements. Breeding for egg production has added length to that part of her body where the egg-producing organs are located. I have my mind's eye fixed on the photograph of a pen of Wyandottes that score top honors in laying competition, and the birds look in type as far removed from the show bird as the whippet does from the bulldog.

The good layer has a racy body. She broadens out from front to stern, like a good milch cow. The inferior is blocky in build, and may be likened unto the beef ox. There is often as much difference between the types of purebred laying hens of a distinct breed as there is between the recognized table bird and the unrecognized one.

The good layer of any breed is longer in back, neck and legs than the drone. She sings as she goes to business, is gentle in disposition, that is if she has been rightly handled during her growth, and does not cackle a lot over every egg she lays. When handled she will be firm in flesh, and when the thighs are gripped they will be hard in muscle, indicating stamina and activity, the latter features being the creation of a busy life in the fields or under the scratching shed. The flabby-thighed hen that can produce enough eggs to pay for her keep has yet to be born.—Coleman's Rural.

Cycle Hatcher Co., Oakland, Cal.
Gentlemen: A year ago we started with the Philo System, and raised as fine a lot of White Orpington pullets as anyone would wish to see. The two machines we purchased of you last season have given excellent satisfaction. We shall probably need more this year, and shall use the Cycle machines in preference to a larger incubator. Yours truly, S. N. Haines

MUSTARD AN EGG PRODUCER.

Of old, we have heard of the tiny grain of mustard seed that sprang up and flourished until the fowls of the air found lodging among its branches. But now come tidings of greater wonder still performed by this same mustard among the fowls of the earth. An English poultryman, whose chief delight lies in promoting the happiness and usefulness of his hens, has discovered that small portions of mustard mixed with their food will increase their laying capacity from 15 to 25 per cent.

The triumph is described by the London Globe, in part, as follows: "The experiment began on October 1, 1909. At the end of six months the birds fed with ordinary food had laid 369 eggs, whereas the birds fed with the mustard addition to their food had laid 532 eggs. At the end of the year the birds fed on the ordinary food had laid 914 eggs as against 1023 eggs laid by the mustard-fed birds."

Viewed from the present price of eggs in the states, the significance of such a discovery is great, indeed. The true fancier, however, will be more keenly interested in its scientific than in its financial aspects. As to the exact manner in which mustard heightens the hen's productivity, we are given no clew. Perhaps it adds zest to her appetite or aids her digestion, as is the case of human beings. It is said once to have been the custom among certain poets to write with their feet in hot mustard baths. Thus, according to their belief of those times, an excess of blood was kept from their brains, so that their rhymes and metaphors hatched more safely.

Whether hens are susceptible to the same influence as poets we know not, but it is certain that mustard is a most stimulating substance wherever placed, and there is no reason for doubting that it can stir and warm the ambition of a hen.—Atlanta Journal.

"Do not stuff your hens, thinking that you can make them lay. Throw feed in the litter and make them work for their meals."

Coulson's
MADE IN PETALUMA

Special chick food

If nature hatches the egg, you should save the chick. And you can do it with Coulson's Special Chick Food—the greatest life-saver known in the chicken industry.

This food is the result of years of study to get just the right ingredients in a proper mixture to save the largest possible number out of every 100 chicks.

Coulson's Special Chick Food is an investment, not an expense. It pays big dividends by starting chicks on the road to profit for you. Costs about one cent a chick for four weeks' feeding.

Coulson's Growing Chick Food must be used after the first six weeks, to keep up the steady growth of the chicks up to three months, at which time they are old enough to use Coulson's Egg Food—the standard feed for laying hens.

At your dealer's or from us. Write for the interesting book, "Poultry Feeding for Profit." It's free.

Barred Plymouth Rocks Ocean Blue Strain

Birds of our breeding made a phenomenal record in the hands of our customers this season

Won first place at five of the largest coast shows this season, besides many shape and color specials. Fourteen silver loving cups were won by this strain. Besides we won in every class at the big Los Angeles Show—something no other exhibitor of Barred Plymouth Rocks can claim. Every female in pullet pens for this season is a winner either in pens or singles. Every male heading cockerel mated pens this season is a winner either singly or in pens. We are ready now for your egg orders. Same old price—**$3 and $5.**

Mr. and Mrs. D. T. Wieland, Moneta, Cal.

Take Redondo car via Moneta avenue. Get off at Illinois street, right on ranch.

White Leghorns

A Standard Strain of Great Layers and Great Winners. None superior. Prices reasonable. Descriptive booklet of our stock and farm and recipe for mixing best and cheapest egg-producing mash, sent free for stamp. Eggs, stock and baby chicks for sale. Also a grand lot of cockerels.

On a separate farm, we have an extra fine lot of Buff Orpingtons, from which we can furnish stock, eggs and baby chicks at popular prices.

MODEL POULTRY FARM Irvington, Alameda County, California

This open front door makes perfect ventilation

Mandy Lee is Miles Ahead

It is the only Incubator without a "Sealed," Air-tight Egg Chamber. It supplies the life-giving oxygen freely, draws off the carbonic acid gas, and is saving the lives of millions of chicks.

READ the story of the Mandy Lee triumph in our new catalog. Other incubators are already preparing to imitate and profit by our great discovery.

No guessing with a Mandy Lee

You cannot afford to buy an old-theory incubator which may go out of date and be discarded next year. You should know the truth *now* about the great discovery. The book is free. Ask for it.

There IS Something New in Incubators

We have taken the boldest and most important step ever taken in incubator building. See the openings into the egg chamber? They mean the saving of chicks' lives. It is the key to *right* hatching. Ventilation in the Mandy Lee is now perfect. It goes on all the time, neither above nor below, but right *at the eggs*. Every minute of the hatch the life-giving oxygen is freely passing in to the eggs and the carbonic-acid gas is passing out. And correct ventilation is just one of the great Mandy Lee features.

We Don't Guess—We Measure

The Mandy Lee is as far in advance of other incubators in heat and moisture as it is in ventilation. We do not guess at anything. The sensitive regulator controls heat to the fraction of a degree and *we measure moisture* just as accurately with the Mandy Lee Hygrometer (one sent with every incubator). You know what you are doing. *You* measure and control moisture; *you* control the hatch. The Mandy Lee is the all-season, all climate, all condition hatcher, always producing the most and the strongest chicks.

NEW OUTDOOR BROODER
Heated—Storm-proof

Mandy Lee Brooders give direct contact heat to the backs of the chicks. That is *real* mothering, the most important thing in poultry. Hovers are raised and lowered as weather gets warmer or cooler—heated from end to end. Chicks do not pile up and smother. Write to-day for catalog and full information.

Questions and Answers

THE EDITOR AND STAFF

Questions to be answered in this department should be received at this office one week before reply is expected. Write plainly on one side of the paper and sign full name and address. Unsigned communications receive no attention.

Owing to the great number of queries which have come in, many will be found answered on stock and other pages. The number of queries which has been coming lately has been somewhat embarrassing, but we are answering as promptly as possible, though at the present time many are held over until the next week. We are glad to see this indication of appreciation, for it is proof of the help which The Cultivator may be to its readers.

Blood Meal.

What is blood meal made from and what is it fed to hens for, and in what proportions? Is a small quantity of black pepper a good addition to chick feed or is it harmful?—M. W., Ventura.

Blood meal is made from blood collected in the slaughter houses. It is run into vats, evaporated and the residue powdered. It is rich in protein and is fed to hens in small quantities to increase laying. A half ounce a day is sufficient for laying hen; mix with the mash. Small quantities of black pepper are stimulating to the laying hen, but we would advise care in its use and would not feed it to chicks.

Fertilizing Walnuts.

I write to ask your opinion as to the advisability of using superphosphate, also nitrate of soda in walnut orchard. When to apply, how much of each per acre, and what difference in quantity for trees 20 years old and trees 10 years old on same kind of soil? When a cover crop is grown and the fertilizer applied and plowed under at the same time as the cover crop, and there is an increase in the yield, which would you give the most credit to, the cover crop, or the superphosphate?—Inquirer.

Superphosphate will no doubt be of use to your walnut trees as the soils of this state are deficient in phosphorus. I infer that your orchard has not been fertilized heavily at any time and therefore will need heavier applications of phosphates now than it would if such fertilizer had been applied regularly. An application of the ordinary, 17 to 18 per cent available superphosphate at the rate of 500 pounds to the acre for the 20-year-old trees and at the rate of 300 pounds per acre on the younger trees should be sufficient. The best way to apply this is to broadcast it just ahead of the plow and plow under before the rain falls on it. In this way the phosphate is placed in the bottom of the furrow and when the water is turned on it will go down among the roots and not be fixed in the soil that is being constantly stirred by the cultivator. If green manure crop of vetch, or other leguminous crop is grown in large quantity it may furnish enough nitrogen, as these plants get nitrogen from the air, but if the trees are not making a good growth of dark green leaves an application of 150 to 200 pounds per acre of nitrate of soda put on after the heavy rains are over and about the time the trees are starting the spring growth, will be beneficial.

There are so many different conditions to be taken into account that it is not possible to state whether the great manure crop or the superphosphate should be given credit for increase in production, but if the soil is furnished the materials known to be low and the proper amount of water furnished to keep it moist to a depth of five feet at all times, but not so much water that the soluble fertilizers are carried below the roots and in this way lost, there is no doubt but a very material increase in production can be obtained.

There is not much doubt that if there is sufficient humus, decaying organic matter, in the soil and water applied so as to keep the upper five feet of the soil in a good growing condition there would not be much need of other fertilizers.—J. B. N.

Acetylene Gas Residue.

While cleaning carbide container in acetylene gas generator, I threw the wash water over an orange tree near by, almost dead from black scale. The tree soon began a strong growth, and is now a healthy, fine-looking tree. Is this good for the orange trees, and in what proportion should it be used in spray? Also, is the residue good for applying to soil about trees?—Subscriber, Covina.

It is hardly probable that the wash water caused the destruction of the scale, though the application to the soil might have been sufficient to create a condition favorable to growth. The residue is practically the same as lime. Upon this point Prof. John S. Burd, of the Fertilizer Control, University of California, says:

"Acetylene gas is produced by the action of water on the substance known as calcium carbide. The purer the carbide, the purer and more efficient is the gas produced. The crude carbide commonly used contains some impurities tending to reduce its efficiency as a light producer, and most of these impurities remain in the sludge. These, of course, tend to reduce the yield of actual calcium hydroxide or slaked lime. While we have no exact figures as to the percentage of carbide in the crude carbide used

in local plants, it is probably in the neighborhood of 75 per cent pure. With a carbide of this strength, and using an amount of water just sufficient to convert all of the carbide into acetylene and calcium hydroxide, the residuum would contain, when fresh, about 78 per cent actual calcium hydroxide. This is sufficient, however, to justify its use where slaked lime is desired.

"Generator sludge, like slaked lime from other sources, takes up carbonic acid from the air on standing, and becomes partially converted into carbonate of lime. Owing to the smallness of most acetylene plants, and the consequent necessity of waiting for an accumulation of the material, this partial reversion to carbonate may frequently occur, but is probably not great unless exposed in the open air for some weeks.

"From the agricultural standpoint the value of lime may be due to any one or more of four general causes; the lack of available lime in the soil, its capacity to neutralize acidity, its power of making other so-called plant foods available for the use of plants, and to improve the physical condition of soils. It would lead too far to discuss all the conditions which justify the liming of soils, but it should be said that the practice should be somewhat limited, because of the tendency of the excessive use of lime to liberate more of the plant foods than the season's crop can utilize, resulting in the ultimate loss of soil fertility. On this account the indiscriminate use of lime is not advisable. Lime should have its widest application in the breaking up of the plastic or puddled condition of heavy soils; and on very light, sandy soils, for a few years, to insure the growth of leguminous crops, such as alfalfa, peas, beans, vetches, etc., to be plowed under as green manure.

"The amount of slaked lime to be used on any soil should seldom be more than 100 pounds per acre where the material is compartively pure. Where acetylene generator residuum is available, 120 pounds per acre should answer the same purpose."

Bermuda Eradication.

Writing regarding the eradication of Bermuda Mr. C. E. Lillibridge of Corona says:

"I note request to know how to kill Bermuda grass. The best method is to dig up with mattock and haul off, being careful to get every root. If spots are not more than two to three feet square, rubberoid roofing will smother it in about four weeks. A large patch may be killed by covering with mulch about one foot deep. Old straw or anything that will pack and exclude light will do, except dirt. It will grow through two feet of dirt or more.

Mr. Lillibridge's suggestion carried out will be effective, but where the sides of irrigation canals are covered with the pest for miles, it becomes a serious question which puts the mattock out of consideration. Thorough culture will eradicate it. Has any one a royal road?

Oranges Between.

Am planting oranges and pomelos between peaches and plums, expecting to cut out later after this summer's fruit. How long may I allow these trees to remain without injpry to the young trees?—C. J., Pasadena.

We would defer the orange planting until another spring and take out deciduous trees as soon as the crop is off this summer. Then give thorough fertilization and deepest of plowing to fit the soil for the orange trees. In five years an orchard planted thus would be equal, we believe superior, to one planted between deciduous trees this year. An orange grove costs too much to bring into bearing to begin its life in this way. If you have already the orange trees on hand for planting, then we would advise removing the deciduous trees at once. We have seen trees planted as the inquirer suggests, and they did fairly well, but deciduous trees at bearing age occupy practically all of the ground, and the moisture the young orange trees would require for highest development would probably go to the greedier old trees.

Cherries.

I have some land at Vacaville, Cal., and would like to set it out to cherries, if they would do well. Land is in the steep hills and is very early fruit land. All kinds of early plum and prune trees and apricots do well. Land is what people in the neighborhood call sandstone; it is a light yellowish color and seems sandy and works up well. People tell me that there is danger in putting cherries up on the hillside as it is not moist enough.—G. P. M., Vacaville.

The fact that apricots and pears do well is no indication that cherries will do likewise. The cherry will not fruit well unless it has a deep and moist but well-drained soil. The moisture needs to be present in sufficient quantity continually. You had better take the advice of your neighbors and not plant cherry trees on the land you describe.

We know of a case where a block of cherry trees was planted among peach trees on level land along the Feather river; the peach trees grew well and bore immense crops of fine fruit. The cherries grew to be magnificent trees but never bore a good crop of cherries. A few miles away was an orchard of the same kind of cherries, planted in the dark alluvial deposit of a creek bottom several feet above water level. This orchard brought in returns of $150 an acre the fourth year and always bore heavy crops.—J. W. M.

Spraying Apples.

When and with what should one spray apples to prevent codling moth affecting apples?—C. M. J., Escondido.

See issue of Cultivator of Nov. 3 using any of the formulas given on page 411 numbered from 23 to 27 according to your needs. If the codling moth only is to be reached, formula 26 is good. In a word, it consists of arsenate of lead and water. Six to ten pounds of the lead to 200 gallons of water. Spray as soon as blossoms drop, later as needed.

Planting Pumpkins.

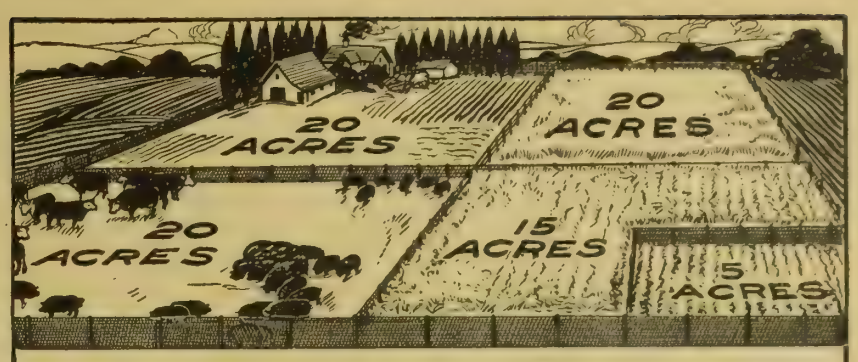
When should pumpkins be planted in the Sacramento Valley?—New Subscriber, Willows.

Pumpkins must be planted after danger of frost is past and the ground has begun to get thoroughly warm. The seed is reasonably sure to fail to germinate if the ground is cold. Culture is same as for cucumbers or melons. The usual planting is 6x6 feet, though sometimes 8x8. May is probably as early as one would want to plant, and planted at that time they will be ripe in October.

Wild Morning Glory.

What is the best way to eradicate wild morning glory?—Subscriber, Otay.

The best way to eradicate any weed is by cultivation. Of course, with morning glory, Johnson grass, and some others, it goes without saying that the cultivator must not be run through infested ground to ground



One Animal and Three Hogs to an Acre

THIS is a fair estimate of the average feeding ability of the soil. On a farm of 80 acres the highest limit of efficiency is 20-acre fields. Large fields diminish the earning power because two small fields alternated will furnish much more support for stock than the same average in one big field. The fence is the important factor; and with the liberal use of gates, unlimited extension and alternation is simple.

The steel in Ellwood fence is specially made from carefully selected stock. It is hard, elastic, tough and springy. The line wires, composed of two or more wires twisted into cables, give each individual wire the shape of an elongated, coiled spring. The fence is therefore sufficiently elastic to take care of expansion and contraction, and yet so rigid when properly stretched as to prevent sagging. The small and permanent mesh is made by weaving one continuous wire throughout the fabric. The mesh or stay wires are so interwoven that slipping is impossible. The triangular truss is the strongest form of construction known. For this reason, Ellwood fence will stand the hardest usage and still retain its shape.

Ellwood Fence is sold in your town. Look for the Ellwood dealer and let him show you his different styles of fence and quote you his low prices. Get his expert advice on your special needs. He is on the spot, buys in large quantities, gets the lowest carload freight rates, demonstrates quality before your eyes and is the man from whom you will get the most for your money.

which is clean. Chemical methods have never proven entirely satisfactory, though along this line we would refer our subscriber to our issue of June 16th, 1910, in which Mr. Iles gives various chemical methods of killing weeds. Any such weed may be killed by covering with mulch so deeply that light and air cannot get to the tops and smothering will result in a few weeks. Some have even gone so far as to use cheap grades of building paper, lapping far enough and weighting to entirely exclude the air. Heavy application of salt has been entirely successful in ridding ground of the pest, but it also kills the soil for several years afterwards.

Twigs Dying.

Some twigs on my peach trees have died. The tops made a heavy growth last year. It is possible I did not take off enough of this strong growth, also allowing water sprouts to grow up through tree. The ground has been well cultivated at all times. Have never sprayed. What is the cause of twigs dying?—Subscriber, Porterville.

The death of the small twigs on the inside of the tree is due to too dense shade. If peach trees are allowed to grow too thick, that will happen every time. It is nature's method of pruning. Nearly all trees will do the same but peaches are one of the most sensitive in this respect.—J. W. M.

Apples Planted After Peaches.

I am removing old peach orchard and would like to know if it is wise to plant young apple trees in the same holes from which the old peach trees are dug. If not, why?—Subscriber, Santa Rosa.

Our preference would be to remove the old orchard entirely, plow, even subsoil, and give clean culture a year to some root or other crop, then plant trees entirely independent of the former location. There is possible danger of root knot or fungous disease and besides apple trees should be set farther apart than peaches. This query was referred to Dr. J. Eliot Coit and he answers:

"In regard to planting apple trees in holes from which peach trees have been removed, I will say that if the peach roots were entirely healthy and free from the crown disease and if the soil is worked up thoroughly and deeply, such a procedure would be permissible. Otherwise, I do not think it should be done."

Arizona Oranges.

What is the cause of superb quality of Arizona oranges? Will planting Arizona stock in California produce the same fruit?—C. J., Pasadena.

Climate and soil conditions are no doubt responsible for the grade of fruit produced in Arizona. Many of the trees in Arizona groves were produced in California nurseries and shipped there, and the result is early fruit in much less quantity than same trees would produce in California. The fact that nursery trees were produced in California or Arizona or Florida, would have nothing to do with quality of fruit when grown in other sections.

Candying Citron.

Will you please give formula for candying commercial citron.—Subscriber.

The process is one requiring some months for completion. The first step is splitting the fruit into halves and immersing in brine. After some weeks in the brine the fruit is freshened, the center scooped out and the rind candied by immersing for sometime in weak syrup which is strengthened day by day until made very heavy. It is taken from this last syrup and dried.

Blasting Hardpan.

I have 20 acres of land to plant in orange trees this spring—hardpan two to four feet from the surface. Am told blasting will be beneficial.

We would like to know the nature of the hardpan and of the subsoil, but with no more information than we have, we would say that blasting would probably be necessary to secure best results. The orange is more or less of a surface feeder, but at the same time it must have deep anchorage. Besides hardpan four feet from the surface, if impervious to water, might prevent healthy growth.

Curing Calf Skin.

Can you give me formula for curing calf skin with hair on?—G. D., Beaumont.

We cannot, and will ask our subscribers to help inquirer.

Tents for Frost Protection.

Has anyone ever made a thorough trial of putting tents over lemon and orange trees to protect them from frost? If we could get some cheap yet strong material this might be more practical than smudging. Tents of duck are expensive, but made of burlap they should last four or five years. Would it do to leave tents over trees for six or eight weeks?—Subscriber, Lakeside.

Of course the tents would protect the trees from frost, but we imagine this plan would be similar to the Everest lath house construction at Riverside. In that case 20 acres of orange grove was covered with lath house similar to that used by nurserymen. The expense is almost prohibitive and, apparently the trees do not do well, for it was removed after a year's trial. We would not advise leaving tents over the trees for several weeks. It is doubtful if the burlap would last four or five years because of the strain upon it in putting on and off. The expense of material, together with expense of placing the tents would, we believe, be greater than smudging. If any of our subscribers have ever made experiments along this line we would be glad to hear from them.

THE NEW STANDARD MOWER

The cost of the best mower is less than that of the cheapest mower by the end of one season's use.

Time and Labor Saving Devices and Devices for Preventing Friction Found Only on the New Standard Mower.

The best mower gives the best service all the time.

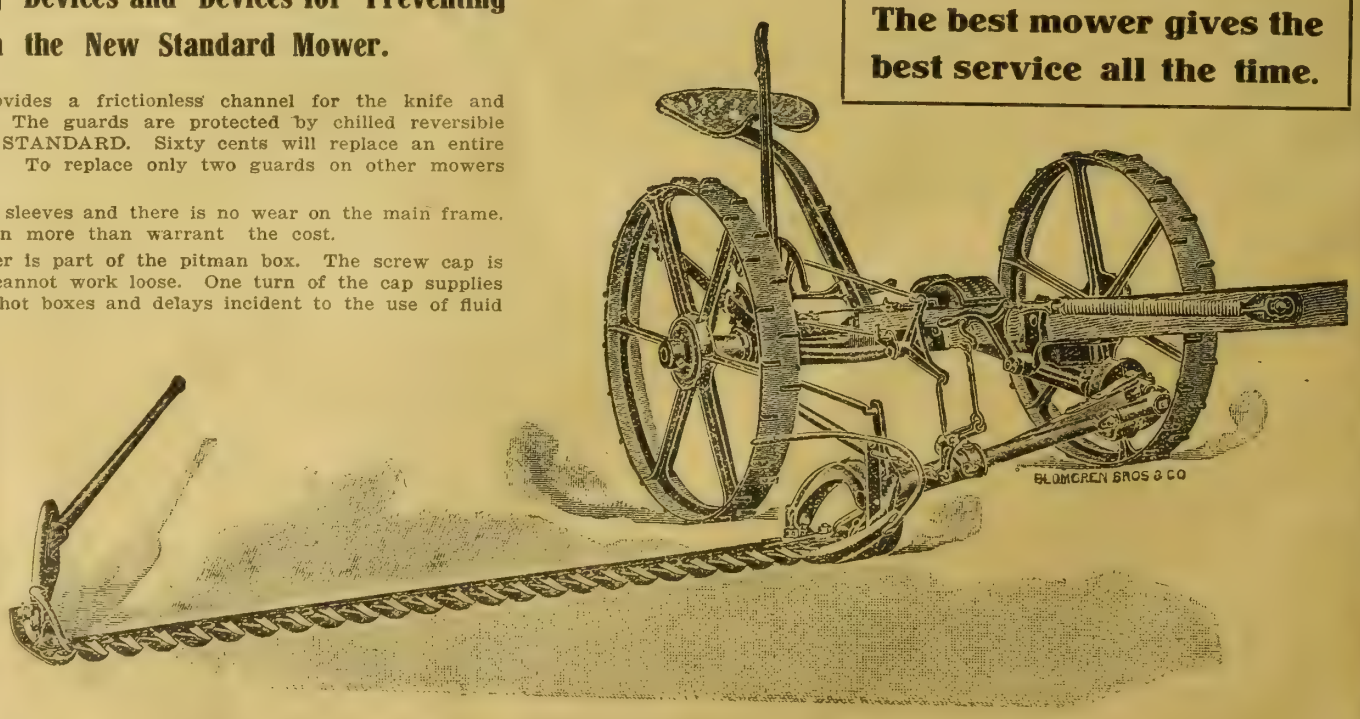
The floating cutter-bar provides a frictionless channel for the knife and prevents wear on the guards. The guards are protected by chilled reversible rails, found only on the NEW STANDARD. Sixty cents will replace an entire set of rails on a five foot bar. To replace only two guards on other mowers will cost as much.

All shafts run in detachable sleeves and there is no wear on the main frame. The benefits of this construction more than warrant the cost.

A force-feed cup grease oiler is part of the pitman box. The screw cap is held in place by a spring and cannot work loose. One turn of the cap supplies ample lubricant and overcomes hot boxes and delays incident to the use of fluid oil. Hours are saved during harvest (when hours mean money) by this device, found only on the NEW STANDARD.

These are only a few of the prominent labor and time-saving devices which decrease the operating cost and add to the life of the NEW STANDARD MOWER.

Our illustrated Hay Tool Folder describes these features in detail and also tells why the New Standard Mower is the Easiest Running, Most Powerful Cutting and Longest-Lived Mower made. Write for the folder today.



NEWELL MATHEWS CO.

Implements—Spring Vehicles—Wagons

LOS ANGELES—CALIFORNIA—STOCKTON

Curing Meats Without Smoking.

I am anxious to secure recipe for curing meats without smoking, and fancy by rubbing heavily with black pepper it might be successfully done. When I was living in Washington a neighbor gave me a couple of hams which had not been smoked but were black on the outside with pepper. In slicing we cut the outside away and the meat was the most delicious I ever ate. It was sweet and tasted much like fresh pork.—Subscriber, Chico.

We are unable to learn of a special formula for curing such meats. Below we give formula for pickling and presume that if coated heavily with black pepper with addition of olive oil to prevent outside from moulding, the meat would keep in a cool, dry place very well. However, we will ask our subscribers who may have had experience to inform us. An excellent brine follows.

Brine for Beef, Hams and Shoulders. —To 100 pounds beef, take eight pounds salt, five of sugar or five pints of molasses (Orleans best, but any good will do), two ounces soda, one ounce saltpeter, four gallons soft water or enough to cover the meat. Mix part of the salt and sugar together, rub each piece and place in barrel (oak is best) having covered the bottom with salt. When the meat is all in put the remainder of salt and sugar in the water. Dissolve the soda and saltpeter in hot water, add it to the brine and pour over the meat; place a board on top of meat, with weight sufficient to keep it under the brine. Let the pieces intended for dried beef remain in the brine for three weeks, take out, place in tub, cover with water, let stand over night, string and dry. String it (smoke for a few days if you like), hang it up to ceiling over kitchen stove, turn round once a day so as to give all parts an equal exposure, and let remain for three or four weeks. Test by cutting a piece, which should be well dried on the outside and free from rawness to the center. When dried, sprinkle with ground black p pper, put in paper sacks, tie up tightly, and hang in a cool, dark, dry place, or put, without sacks, in an empty flour barrel, and cover closely. Boil brine, skim well, let cool, and pour over the bony pieces left. These are good boiled and eaten either hot or cold, and they will keep good for several months. Tongue may be pickled with the beef.

Feeding Barley.

Replying to an inquiry as to feeding barley, Mr. E. B. Stone of Campbell gives of his experience as follows:

"I soak whole barley in water over night, then put in a box and cover with a wet sack, keeping same damp at all times. I feed this at night and the hens seem to miss it very much if I feed anything else. An ounce before sprouting makes a big meal for a hen. Make seven boxes large enough to hold one day's feed. In cold weather seven boxes will keep one coming for each day, and warm, sunny or rainy days, seven boxes will be too many, as the roots become so matted that the hens do not like it so well; discontinue the sprouting in such cases for a day or so, and reduce the boxes to four or five, then when a cold snap comes on sprout a feed or two in the day time as well as night, until caught up again.

Sprouts should be one inch or so long; if for any reason they are not, let them set a day longer and boil the same amount of barley per hen, feed when warm and the hens will cackle 'thanks' every time."

Legal

Edw. L. Payne, attorney, 301-304 Douglas Building, Los Angeles, will answer legal queries in this department.

Immediate mail replies cannot be given except where fee to Mr. Payne is paid. When replies are wished in Cultivator address query to 115½ N. Broadway. Los Angeles.

Acquiring Right to Ditch.

A owns land and pumping plant; B's land lies between A and C; C wants to buy water from A, and wants to make a ditch through B's land. If B allows him to go through his land will it give C a right so he cannot stop him, and how long before he acquires a right. In what way can B allow him to go through without giving C a permanent right.—Subscriber, Burbank.

If B allows C to make a ditch or run a pipe through B's land and permits the ditch or pipe to remain there for a period of five years, during which time C claims the right to have it there, C would in all probability acquire the right to keep it there. At any rate, such a state of affairs would furnish a very good lawsuit.

B might lease the right to C for a number of years for a nominal consideration and if, at the end of the lease, it should be renewed or terminated, it would furnish no basis for claim of permanent rights by C. Or, B might give C written permission to maintain a ditch for a certain number of years, with the express understanding in said written permission that no permanent rights should be acquired, and that the ditch should be abandoned on demand of B.—E. L. P.

Trespassing Sheep.

We have an orange grove with wire fences surrounding. There is a herd of sheep which graze daily in this neighborhood. The sheep are constantly getting into our ground and injuring our trees. How can we remedy this evil?—B.

As your land is enclosed with a fence, it may be that you could recover damages for the injury done by the sheep. The law says that no damages can be recovered unless the land is entirely enclosed by a "substantial" fence or other enclosure. I am of the opinion that that means the fence must be such as would ordinarily turn stock, but there is a wide field for speculation as to exactly what the word "substantial" means. The fence might be substantial and still not such a fence as would turn sheep or chickens. It would seem that a court ought to be liberal in its construction of the statute and give damages in a proper case, even though the fence might not be such as would keep out the smaller animals, so long as it was a reasonable, substantial fence for ordinary purposes.

I do not know whether Senator Gate's bill to amend the law has passed the legislature or not, but even if it has, it would not affect damages already incurred.—E. L. P.

THE KILLEFER CYCLONE WEEDER

We have Killefer Cyclone Weeders of all sizes on hand. This is a most effective tool for keeping down the growth of weeds after rains or irrigating on orchard, beet, bean or grain land. Guaranteed to do twice the work with the same team of any other tool. As the knives overlap each other, it is impossible to leave anything in their course.

Built in 6, 8, 10 and 12-foot sizes. Blades can be attached to cut in or out as desired.

OUR MONARCH CULTIVATOR

While designed more especially for field use, is now becoming a favorite among orchardists where deep cultivation is desired.

This is the strongest chisel tooth cultivator on the market, and we guarantee it to give absolute satisfaction. We make special hard steel chisel points that will outwear all others. This is a good cultivator for bean or beet culture.

OUR JUMBO SUBSOIL PLOW

Our "Jumbo" is built for deep, heavy work. Shin point and land slide are made of hard steel, and the entire construction is designed to stand all kinds of hard usage. You cannot buy a better tool for breaking subsoil hardpan in orchards.

We have made a careful study of the requirements along this line and know from actual experience that this plow will do the work that is required of it.

Timely Ranch Suggestions

KEEP AN AUTOMOBILE.

It is wonderful how long it takes the world to outgrow an idea once it has been deeply planted in the minds of the people. There once was a stage when a man was regarded as an aristocrat who had a reaper and many of our readers can doubtless remember when telephones and electric lights were thought of as luxuries only for the rich.

Automobiles used to cost $4000 or $5000, but they don't now. Machines that are a hundred times more handsome and efficient than the first high priced models are comparatively cheap, and you can get a regular trophy winner for $1600. That is, you can if service is what you are after instead of mere style. Of course, you can yet pay as much as $25,000 for a car if you have money to throw to the birds, but the most of us can get along without ultra refinements of style and finish. What a farmer wants is a medium car both in weight and price and leave the expensive cars with the "do dads" to burn up the money of the city people. A machine will save enough in time, money, horses and patience to pay for itself.

It doesn't cost so much to keep an auto going as you've been lead to think. It takes some money for gasoline, but for all that, doesn't it take money to feed horses too? An automobile is no longer a pretty luxury. It should be a recognized factor in the political and financial life of every farm community.

Let's get down to figures. We have a letter telling about one man's experience with a $1500 car. "I have used my car on all kinds of roads and in bad as well as good weather. The speedometer shows 7600 miles, yet I have not had a particle of engine trouble and the cost of maintenance has been very small. I have driven as much as 107 miles on five gallons of gasoline and carried four people." You wouldn't call this cost of maintenance very high when it takes not to exceed 75 cents to carry four people a distance which would be a good two days' journey for a team of horses. Fifteen to twenty-five miles on a gallon of gasoline is pretty cheap traveling.

Instances multiply showing that with a good reliable machine the expense of running an automobile is not anything like what it would cost to keep horses to do the same amount of work. Here is the expression of a practical farmer who has adapted the motor car plan of doing things: "In my experience covering from about April 1 I have never paid out a penny for repairs and my stock is kept at work in the fields. I find it a good deal cheaper than a team and besides it is awfully hard on stock to haul heavy loads over the graded roads and paved streets. It is a time saver and requires no feed while not in service which cannot be said of a team. I am well pleased with my venture and can heartily recommend it to others."

Along with the above statement, put down this other one which is interesting in that it sums up the total expense for one year of one of the smaller models: "I have had my runabout for a year and have kept an accurate record of all my expenses. I was surprised to find that it only cost me 29 cents a day to run 100 miles a week. My total expenses for 5000 miles were $106.40. I have never laid up on the road for repairs and my car is going better than ever."

Here is also a western farmer who is quoted as saying: "I had half a dozen cans of cream in the back of my motor car, and carry them six miles to market. It takes me about forty minutes when everything is favorable. With a team it would require two hours." Another says: "I have used my car for a great deal of small marketing during the past fall. I live about twelve miles from town and dispose of many fine apples as they ripen, since I could take them to town in a short time. Altogether I took over 100 bushels that way. Of course, we take nearly all our cream, butter and eggs in the car, because that is our way of going to town in good weather, and it has saved me money because fruit and other products were sold when fresh and so at a higher price."

There is no doubt about it—the automobile on the farm is a reality which is rapidly making its way and has come to stay. The desirability and economy of a motor car cannot be questioned. The only problem the farmer has is to be sure that he buys the kind of a car which is best suited to his needs. The one cardinal principle to remember is that the car you buy must have proven itself worthy on country roads. Don't let a demonstrator take you out for a spin and call that enough. Look into the reputation of the company who makes the machines and look into the contest record of the car itself. Speed contests count for little, but if a car has made good with excellent road scores then it will stand up under rough service on the kind of country roads that every farmer encounters.—Nebraska Farming.

WHY NOT THE GRANGE IN SOUTHERN CALIFORNIA.

By Horace G. Keesling, San Jose.

Your mention of the Grange in connection with Farmers Club meetings in recent Cultivator touches a responsive chord in one who lives in the California Grange belt, and creates a feeling, in fact a knowledge, that the Grange would be of great benefit not only to Southern California but everywhere in our big state where tillers of the soil exist in sufficient numbers to hold a charter.

All intelligent and progressive country people who love the country, the things that grow there as well as the physical, mental, moral and I may say spiritual wellbeing of the community in which they live, should belong to a Grange of Patrons of Husbandry.

Social intercourse and the exchange of notes and information which have to do with the financial side of country life are not all the benefits that may be derived from the Grange.

Here are some of the reasons why farmers should join the Grange:

It is inexpensive. It is the only farmer's organization national in character. It has stood the test for thirty-two years and has not been found wanting. It has exerted greater influence in securing state and national legislation in the interest of agriculture than any other agency. It is

Don't Put Off Painting— It Will Prove Costly

The longer you put off painting the more oil and lead the job will take.

While you wait your buildings rot, exposed to the weather.

The cost of paint made of

"Dutch Boy Painter"

white lead and pure linsced oil is not so high as you may think.

For an average house, the cost now of this genuine old-fashioned, mixed-to-order pure white lead paint is not more than $4 or $5 greater than it used to be. Much cheaper than repair bills.

Department of Agriculture Selection No. 160. An early maturing yellow flint corn that has produced 78 bushels shelled per acre. Will produce a fair crop with a minimum of water if planted early. Sold only in the ear. Price $3.00 per 100 pounds, smaller lots five cents per pound.

J. B. Neff
Anaheim, Cal.

officered by practical farmers who know the needs of farmers. It has secured national legislation in the oleomargarine law, the establishment of the Interstate Commerce Commission, the establishment of rural free mail delivery, and state legislation in the interest of the farming population. It has exerted the greatest influence known in breaking up the isolation of farm life and in making farm life attractive to the boys and girls, bringing sunshine and happiness into the farm home to such an extent as has never before existed. The above are not all the reasons. In a local way each grange has its own problems to solve, and in the unity of spirit and desire for betterment infused into its membership by its ritualistic teachings the grange is an irresistible power for good.

The leading country people of Santa Clara valley believe in the grange, as is evidenced by the large membership of five subordinate granges. San Jose grange meets weekly at San Jose and is often called the Mother Grange, being visited freely by members of other granges who gain at this central location much that is of use in their home granges. Particularly is this so when the season for fruit sales approaches and during the session of our state legislature. Orchard City Grange meets at Campbell, the second and fourth Tuesdays of each month. On alternate Tuesdays meetings are held at the homes of members. There is a live grange at Sunnyvale, and one at Mountain View. Lincoln Grange meets in its own hall at the corner of Mountain View and Prospects roads.

To give an idea of work done and matters discussed at regular meetings I append a list of grange committees whose duty is to report at each meeting: Legislation, education, co-operation, woman's work, relief, farm and orchard, gardening, fruits and markets, music, visiting.

Santa Clara County Pomona Grange, made up of members from all other granges in the county, meets once in two months, generally at San Jose when not invited and entertained by some other grange. In May of this year the Pomona meeting will be held at Campbell, and there is now talk of a big two days' meeting.

A Quaker lady visited Lincoln at the White House in the winter of 1864. "The Lord hath appointed thee," said she; "the Lord will sustain thee, and the people love thee. Yea, as no man was ever loved before, does this people love thee. Take comfort, friend Abraham. God is with thee; the people are behind thee." The effect of the words was easy to see. As when the lights suddenly blaze behind a cathedral window, so the radiance illumined those rugged features and poured from the wonderful eyes; the gaunt form straightened; the mouth became beautiful in its sweetness, as it said to her, "You have given a cup of cold water to a very thirsty and grateful man. You have done me a great kindness."—The Standard.

Hot water is most efficacious in relieving a paroxysm of coughing, and is much better than ordinary cough mixtures, which often spoil the digestion. The water should be almost boiling, and should be sipped when the attack of coughing comes on. The irritation is relieved because the hot water promotes secretion which moistens the irritated surfaces. Hot water also promotes expectoration, and so relieves a dry cough.

WICK'S WHITE FOWL FARM, Moorpark, Cal

Business

GOOD NAME WORTH PROTECTING.

The surest indication of superior quality in merchandise is when the successful article is largely imitated. The surest sign of the poorest and most unreliable merchant is one who willfully misleads his customers into the purchase of inferior substitutes in place of the genuine article actually desired.

The F. Mayer Boot & Shoe Co. of Milwaukee manufacture the well-known Mayer Martha Washington Comfort Shoes, which, due to their superior merit, enjoy a big sale. Unscrupulous and short-sighted dealers, eager for bigger profits, have permitted themselves to be led into the practice of selling shoes similar in appearance but inferior in quality, representing them to be Martha Washington Comfort Shoes.

The Mayer Company have been compelled, for their own protection, to inaugurate an extensive campaign to put a stop to the unlawful use of the name and picture of Martha Washington and will punish the guilty offenders.

The practice of substitution obtains so generally that it is well for our readers to exercise a little caution in buying supplies. Our readers are no doubt familiar with the large Milwaukee shoe house, the F. Mayer Boot & Shoe Co., whose advertisements have appeared for a long time in our publication. This company makes one of the finest lines of quality shoes in America, and their reliability is well established.

In addition to the Martha Washington, they also make the Leading Lady, fine shoes for women; Honorbilt, fine shoes for men; Yerma Cushion Shoes and Special Merit School Shoes. The Mayor Company now has facilities for making 9000 pairs of shoes per day.

GREAT ANNOUNCEMENT.

There is no problem connected with the production of wealth that has been given greater attention, during the last ten years, than that of raising water for irrigating purposes by means of pumps.

The government, in order to raise the standard of such apparatus so that it might surpass anything that had been accomplished in other countries, demanded exceedingly high efficiency in their proposed pumps, and its engineers have not been disappointed in this respect, as far as it concerns the output of the Byron Jackson Iron Works.

The U. S. government and some large power companies, recognizing the reliability and quality of the pumps built by the Byron Jackson Iron Works are installing them today to the exclusion of everything else, and have even gone so far as to permit the Jackson pumps, direct connected to electric motors, to be operated the year around without employing an electric meter, because the latest design of such pumps has been such that it can be foretold what horsepower is required to operate these pumps, and that this horsepower will remain constant through the whole range of head, within the capability of the pump, no matter whether the level of the water in the sump or well is high or low, and the pump delivering over its normal capacity or the exact capacity for which it was made.

SPRING MILLINERY INDICATIONS.

Many odd ribbons and ribbon effects are utilized on the spring hats. There is a preference accorded to velvet ribbons, to bows of piece velvet, and to ribbons of fancy weave that have velvet interwoven in their design. The most prominent in these effects is a white satin ribbon having a wide velvet strip. There are also paisley designs in soft weaves, and considerable uncut velvet, not so much in ribbon as in piece goods.

There is no indication of a long and strong run on any one item or style, and this fact alone means tidings of great joy to the trade in general.

It is prophesied that it will for divers reasons be a season of high color effects, but the word from over the seas is that Paris still favors black and white. Bright blue, blue, in fact, of all shades, is strong, as well as are purples and all the rose colorings.

No one straw has precedence over the others, and practically all shapes have equal chances of success. so that at the time of writing, the trade feels confident of good results, if not in all at least in many of the lines offered.—The Millinery Trade Review.

Entomology and Bees

QUEENS AND QUEEN REARING.

By C. A. Wurth, Wapato, Wash., Before California State Bee Keepers.

The name suggests something or some one superior, supreme, or above the ordinary. In ancient days this one inmate of the bee hive was called the king bee; such great writers and students as Socrates, Virgil and others refer to the mother bee as the king. Unlike modern society the humble gatherers of sweets recognize no aristocracy, blue blooded races or heirs of royalty; if for any reason the queen becomes unable to perform the functions she acquires by nature, and menaces the prosperity of the colony she is immediately replaced or superceded by a young and vigorous queen, which is reared and developed by the bees themselves by the application of a fundamental and natural law by which the bees change and transform an egg or larva, which if left as primarily intended would develop into a worker bee, this change of sex from neuter to female being made possible only by the continuation of feeding royal jelly or a food containing chyme, which is secreted in the bodies of the nurse bees themselves. By experiments we have concluded that this same food constitutes the menu of all larvae until 36 hours of age. After the young queen has hatched, has been fertilized and begins her duties of perpetuating the existence of the colony, the old queen mother in her majesty and with her brilliant record of the past, asks for no old age pensions, or other concessions of the colony of which she is mother, but she ceases to perform any further functions and dies and mayhap is aided to the end of her existence and is then carried forth and dropped without the portals of her late kingdom, as the bees recognize her only as an obstacle and impediment to progress.

Bees are great political economists. Unlike the workers in the fields of human endeavor they fail to see the advantage of providing and caring for a vast army of non-producers, but how different is their attitude toward a vigorous, prolific queen, in the height of brood-rearing. She is attended by a small company of worker bees who supply her with food and protect her from any impending danger, even to the extent of sacrificing their own lives. And it is well that they should, when we realize the importance and value of the queen, the mother of all she surveys, and while she may not and does not govern all the inhabitants of her domain, she is the basis of all prosperity in the future.

And how strange that we as bee keeprs, giving the care and study of this pursuit our attention for years, still fail to realize the importance of having strong, prolific queens in all colonies. I sometimes think it foolish for bee keepers to spend months in securing a crop of choice honey and then dispose of it in less than one hour's time, when if half the effort was used the bee keeper could dispose of it at a good price. It is just as foolish to try to build up a strong, populous colony by having the colony headed with a poor, low vitalized and impoverished queen, and how to secure prolific queens has been the endeavor of some of our most prominent bee keepers for years past.

In no one thing in successful bee keeping does quality count as much as in the queen, and as this importance of quality of queens has been recognized for over a half century, it is not strange that we have been endeavoring to improve the quality of the queens and also promote a system or provide a means of securing the strongest and most prolific queens by some artificial method and not rely entirely upon the bees for a better race. Therefore by finding under which condition we are able to secure the most vigorous queens we can use them as working basis. It has been only about thirty years since the first system of rearing queens artificially was introduced, and strange to say with all our progress along other lines that system stands today, modified and changed in some minor details, but still the basic principle is intact. "Have all cells built in strong colonies," or under the swarming or superceding impulse. This system as presented to us over twenty years ago by one of the masters of apiculture has not been improved upon in the main essentials and it is my opinion that this, the Doolittle system, is used more extensively than all others combined.

Queen rearing has been alluded to as the poetry of bee keeping. I will concede that it is a very fascinating study but as a business it requires strict attention and adaptability to secure the greatest returns. It is necessary to have some extra equipment if one wishes to carry on artificial queen rearing. I quote from Mr. E. W. Alexander as follows: "The most common and worst mistake that can be made in rearing queens is to save the natural cells and virgin queens from colonies that have cast natural swarms. Almost daily during the summer season we see bad results in our apiaries from excessive swarming and then so many will do the very thing of all things that will perpetuate the desire to swarm, by saving virgins and cells from the colonies that are first to swarm." Mr. Alexander further says in regard to this way of requeening that it is a matter of but a few years until the bees degenerate into a colony which does little else but swarm.

There is a variety of opinions in regard to the question of whether it pays to rear queens when one is running bees for honey or buy them from a queen breeder. For the average bee keeper who specializes on honey production it is my opinion it pays him to buy his queens from a responsible queen breeder, but if one can spare the time and wishes to rear his own queens, he can do so by following any of the several different queen rearing systems used today.

I will not attempt to give here any outline of queen rearing. I will only say that no matter what or whose system you prefer there are three cardinal principles to successful queen rearing. First, breeding queens should be the best obtainable. If your stock is inferior secure a good tested or breeding queen from some reputable queen breeder; second, have your cell building colonies strong, exceptionally strong, and be sure to have the colony rearing brood to its fullest capacity, if necessary, stimulate by feeding; third, watch your drones, for it is but a wasted effort to try to improve your bees by rearing queens unless you also try to govern the fertilization of the queens.

Scientific investigation has proven to us that such diseases as black brood and paralysis, as well as low vitality are inherited from impoverished queens or queens with low vitality. So it behooves us to be ever aware of the condition of the queen.

Mayer
MARTHA WASHINGTON
COMFORT SHOES

Sensitive, feverish, aching feet get lasting relief from Martha Washington Comfort Shoes. They fit like a glove and are as easy as a stocking. No buttons or laces—just complete and lasting comfort.

MARTHA WASHINGTON COMFORT SHOES

rest the feet. Be sure you get the genuine. There are many inferior imitations. Reject as counterfeit anything offered that has not the Mayer name and Trade Mark stamped on the sole. The best merchants handle the genuine.

The real Martha Washington has the name and the Mayer Trade Mark stamped on the sole. If you can't find a dealer, write to us.

Free—If you will send us the name of a dealer who does not handle Martha Washington Comfort Shoes we will send you free, postpaid, a beautiful picture of Martha Washington, size 15x20.

We also make *Honorbilt* Shoes for Men, *Leading Lady* Shoes, *Yerma* Cushion Shoes, *Special Merit* School Shoes and *Mayer Work* Shoes.

General Household Notes

A THOUGHT FOR EACH DAY.

Monday—You have not fulfilled every duty, unless you have fulfilled that of being pleasant.—Charles Buxton.

Tuesday—
Build as thou wilt, unspoiled by praise or blame,
Build as thou wilt, and as thy light is given;
Then, if at last the airy structure fall,
Dissolve, and vanish, take thyself no shame—
They fall, and they alone, who have not striven.
—Thomas Bailey Aldrich.

Wednesday—
What do we live for if not to make life less difficult for each other!—George Eliott.

Thursday—
Haste not! rest not! calmly wait;
Meekly bear the storms of fate
Duty be thy polar guide;
Do the right what'er betide
Haste not! rest not! conflicts past,
God shall crown thy work at last.
—Goethe.

Friday—"There is hardly any bodily blemish which a winning behavior will not conceal or make tolerable."

Saturday—
Do the woes of life surround you?
Face them.
Chase them.
He who ruleth over all,
He will help you, though you fall,
Gladly hear you when you call,
From His heaven above.
Have you any wrong to right? Right it.
Do you have a sin to fight? Fight it.
God, Himself, will help you win.
Let His Spirit enter in,
Making right the heart within,
Fit for heaven above.
—John Starling, in the Observer.

Sunday—Let us be persuaded that nothing is due to us, and then nothing will disturb us.—Fenelon.

"MAN WITHOUT A COUNTRY."

By Otis M. Sisson.

It is just ten years since I first saw "the big Dutchman." He and some thirty or forty more of us were working on one of the many fruit farms to be found on every sand bar or space large enough for an orchard along the great Snake River as it winds from Lewiston, Idaho, through a narrow canyon, to its juncture with the Columbia.

Adolph was the first of the hands with whom I became acquainted. He had been at work for several days, and, at the foreman's request, helped me to get started. His accent was plainly German, and I tried a few phrases in that language, with which I was not especially familiar, that seemed to amuse him. When he smiled, his mouth reached seemingly from ear to ear, and his large, white and perfect teeth glistened brilliantly. His eyes were light blue, small and twinkling. His forehead was rather low. His funny German accent and twisted English made it difficult for one to refrain from laughing outright.

That evening I took a seat on a bench in front of the little bunkhouse which he occupied together with another German. After making a great ado and threatening to drive me away, he sat down himself, swinging his head from side to side, with his beady eyes hidden beneath half-closed lids.

He proceeded to catechize me quite thoroughly concerning my past life and prospects, making several pointed comments thereon. On the other hand, he appeared rather reticent regarding himself, and I felt rather than saw a reserve back of his apparent jollity and good humor. So I did not press him for many facts about his life. Indeed, I found much amusement in listening to his quaint dissertations and arguments, and was content to let him do most of the talking. He would argue spiritedly upon the women of Germany as compared with those in the United States. Sometimes he would praise German scenery and climate and other things, but always at the expense of America.

Thus he would discourse each evening, needing but a word to set him going. It was the fourth evening after my arrival. Becoming curious, I asked him, if Germany so much surpassed this country, why he did not return. I had never before seen such a mixture of emotion on anyone's face as my question stirred upon his. But with great effort he became calm again, and, without the anger which I quite expected him to show, he explained that it was much easier to make money over here. This explantion hardly satisfied me, however, and I went to my own bunk wondering at his action.

About a week later I heard his story. We had become quite "thick," as the saying goes, and one evening, as we were sitting in front of his little cabin, he told it to his partner and me.

He was born at Tonning, near the mouth of the Eider River, in Schleswig-Holstein, ten years after the war which resulted in the addition of that province to the German Empire. His father had favored Denmark, but Adolph grew up with great love and pride for and in the empire.

When he was eighteen the time came for him to serve in the army, as every able-bodied man must do in that country. He was placed in a regiment in Southern Germany, far from home and from his relatives.

Being naturally impetuous, he soon acquired the dislike of his superior officers by resenting certain needless restraints and insults. His commanding officer was one of those notoriously severe men for whom the German army is noted. Adolph was thrown into the guardhouse and shamefully beaten.

He resolved to escape immediately upon his release. With great difficulty and risk he did so. Passing through Switzerland, he entered France, and after a few days obtained a job on an American tramp steamer at Marseilles. For several years he sailed on this ship, rounding the globe twice, and at last landing at Boston.

Since that time he had worked all over the United States, never taking out naturalization papers, for, like Philip Nolan, there was but one country for him, yet fearing to return to the punishment which would most certainly be meted out to him as a deserter. So he had come to this faraway Snake River Valley.

"But don't you see that you are really a traitor to your country, after all?" I asked. "And think; your army service would long ago have been over, and you might have been living happily among your friends and kindred."

"Nein, nein," he answered hoarsely. "I would have been dead, dead so long time ago."

The next morning his old partner told me that Adolph kept him awake all night, moaning and talking in his sleep, but that he had been unable to

make out what he said. He appeared as jolly as ever that day, though, and sang and whistled a great deal. The "Lorelei" seemed to be his favorite, intermingled with snatches from late popular songs.

A couple of evenings later I thoughtlessly repeated, as I sat down for our usual chat, those touchingly beautiful lines of Friedrich Ruckert:

"Aus der Jugendzeit, aus der Jugendzeit,
Kommt ein Lied mir immerdar."

We had no talk that evening, for he turned back, slamming the door, and came not out again. I upbraided myself roundly, but promised to be more tactful thereafter.

In the morning his partner informed me that he had left, with his few belongings, during the night. I could not help comparing him with that other man without a country whose story Edward Everett Hale has so vividly told.

* * * * *

One year afterward I was atending a Fourth of July celebration in a large town in Washington. Standing on a crowded corner, looking about, I found Adolph. He appeared as a man tormented by a never-ceasing inner struggle, and seemed much older and thinner than when I had last seen him. His interest was awakened now, however, and his eyes gleamed as a band of marching children saluted the flag. The patriotism with which the air was charged held him to the spot. He was very glad to see me, and shook hands with unfeigned pleasure. To my invitation to take in the sights he readily consented. He said he had stood on the same corner all morning. We slowly threaded our way through the brilliant array of stands and small shows and the gay throng.

Across the street a graphophone was giving a free concert to an ever-changing rgoup. Thither we went. It was playing the most famous national hymns, the "Star Spangled Banner," most beautiful of all; "God Save the King," the Briton's favorite; the "Marsellaise," and then—I watched Adolph curiously as it commenced "Die Wacht am Rhein."

He stood, his face working strangely, until came the line, "Firm stand today thy sons to guard the Rhine," when, with tears rolling down his face, he turned, and, pushing me almost roughly aside, forced his way rapidly through the crowd and disappeared.

That evening. as I stood watching the final grand parade and the beautiful fireworks display, a boy handed me this note:

"Lieber Freund:
"I am to the Vaterland gone.
"Fahrwohl,
"ADOLPH HARTT."

—Epworth Herald.

EASTER HAMS.

The date of Easter this year is April 16. The following, clipped from an exchange, may be a hint for some for the feast on that day:

On Southern plantations the selection of a ham to grace the Easter table is made at the first hog-killing of the previous autumn. A large one is carefully chosen, and special attention is paid to the bagging. After going through the usual process of curing and smoking, it is marked and set aside until Easter. Then it is cut out of its bag, washed carefully, put into cold water, and allowed to simmer gently until half done. It is best to set the ham boiler on the back of the stove, and there is no better rule than that of old negro cooks, to see that the "kettle only smiles on one side of its mouth."

While the ham is cooling—for it should be allowed to get perfectly cold before it is skinned and stuffed—the stuffing is made, as follows: A good parcel of cabbage sprouts or mustard salad, a handful of parsley, a small piece of stale bread, a slice of onion, all chopped together with plenty of black pepper. Deep gashes are then made in the ham, and these gashes are tightly stuffed to the very bone with the greens. After that the ham is baked until well done—an hour will probably be enough, unless the ham is unusually large. Before putting in the oven, sprinkle with a thick layer of cornmeal and brown sugar. Then pour about a half pint of water into the drip pan and set in a close oven. There is no need of basting, as the rising steam makes moisture enough. Before taking to the table the crust formed by the coat of meal and sugar should be carefully removed, round splotches of black pepper sprinkled on, and the dish garnished with parsley. When the ham is cut, the green veining with its pink flesh makes it almost as ornamental as it is delicious.

AN APPEAL

TO YOUNG MEN AND WOMEN

Hurrah! California gets the Panama-Pacific Exposition!

Now let's to business. Things will hum.

Millions of people are coming to California.

Great commercial development is already in progress.

The unlimited possibilities and boundless opportunities of the great West will be seen and appreciated as never before.

All California will be prosperous, and splendid opportunities will be open to young men and women who are trained to hold responsible positions.

Get a business education and prepare for success. Get your share of the prosperity that is coming, by training yourself for something worth while. You cannot begin too soon to plan for your part of this onward progress.

The Polytechnic Business College is reaching out for a larger enrollment. It cannot now supply the demand for graduates of its complete business and shorthand courses, and this demand is constantly increasing.

We are now organizing for our Spring and Summer term. During the months of March and April we want one hundred young men and women to enroll and prepare for business positions. We shall require fully this number to supply the increased demand within a few months.

The Polytechnic Business College is helping thousands of young people on the road to success, and invites you to join its forces and take advantage of its opportunities.

May we send you our catalogue? Write today to POLYTECHNIC BUSINESS COLLEGE, 306 Twelfth St., Oakland. When writing please mention The Cultivator, and get a dozen ornamental visiting cards with your name.

SECURITY BUILDING

Extracted dark	6½
Beeswax, lb	24@30

Hay.

Scott, Magner and Miller say:

Arrivals of hay for the past week are 2,424 tons. These receipts have been enough to take care of all demands on the market, and have moved fairly well owing to the very small receipts of last week, which were only 1,740 tons.

There has been somewhat of demand in the country for hay, owing to the slow growth of grass.

The government is taking delivery this week of the last of the contract which they placed in this market last September, amounting to 3,500 tons. It is going forward on the steamer Mongolia, which sails Tuesday of next week. As we do not look for any further government business for some time, this will naturally decrease the demand on this market to that extent.

Export demand to Hawaii and coastwise has been rather light for hay.

Unless receipts are materially increased, we believe the market will maintain the present prices for the balance of the season.

Alfalfa conditions unchanged.

We quote the wholesale prices in round lots on today's market, as follows:

Fancy wheat	13.00@13.50
No. 1 wheat or wh and oat	10.00@11.00
No. 2 wheat or wh and oat	9.00@10.00
Choice tame oat	10.00@11.00
Other tame oat	7.50@9.50
Wild oat	7.00@9.00
Stock hay	5.00@6.50
Alfalfa, ton	9.00@10.50
Straw	40@50

Grain.

Wheat, No. 1	1.45@1.47½
Barley, fancy	1.23¾
Barley, good to choice	1.20@1.22½
Barley, poor to fair	1.15@1.18¾
Oats, white	1.55
Rye, new crop	1.27½@1.35
Alfalfa seed	18@20
Mustard, brown	4½
Millet	2¾
Flaxseed	5@5½
Broom corn seed, ton	23.50

Feed Stuff.

Alfalfa meal	17.00
Bran, ton	25.00@26.50
Feed cornmeal, ton	33.00@34.00
Cracked corn	33.00@34.00
Rolled barley, ton	26.00@27.50
Rolled oats, ton	29.00@31.00
Middlings	33.50@37.00
Oil cake, ton	40.50@41.50
Cocoanut cake, ton	25.00@26.00
Mixed feed, ton	25.00@27.00
Shorts	25.00@26.00

Citrus Fruit Market

LOS ANGELES, March 22, 1911.

The shipments of oranges within the past two weeks have been the greatest ever known in the citrus industry. The fruit has been first-class, though, unfortunately, it has shown a little decty. The high quality has been a great factor in preventing a slump during the big shipments, yet a slight decline is noticed. The quantity has dropped somewhat, and it is thought from now on the prices will be maintained.

There has been a slight advance in lemon quotations, due to the usual spring demand. Some dealers have been putting in cold storage, which, in addition to the regular demand, has caused a clean-up of every offering. The shipments have been rather light, and will probably be increased from now on.

Shipments.

Shipments of oranges to date since November 1, 1910, 15,054 cars; lemons, 1,856; or a total of citrus fruits of 16,910. To same date last year: Oranges, 9,919; lemons, 1,521; or a total of 11,440.

LOS ANGELES, Friday, March 17.—Ten cars navels sold.

Oranges steady to firm. Californias sell well, and receipts are not large. Boxes, California navels, extra fancy, all sizes, $2.85@3.00; fancy, all sizes, $2.65@2.85; extra choice, all sizes, $2.40@2.60; choice, all sizes, $2.25@2.35.

POINTS ON ALFALFA GROWING.

1. Moisture in the subsoil is as essential as the moisture for germination, to insure a stand of alfalfa. If the subsoil is dry, there must be irrigation soon after seeding.

2. Sow only on a well prepared, settled seed bed; loose, newly plowed soil is a hazardous risk, unless the soil is immediately settled by heavy rains or irrigation.

3. Sow alfalfa seed early if moisture is available; if not, sow at the season when there is the greatest prospect for moisture from rains or irrigation.

4. Sow alfalfa seed shallow. Broadcast and then harrow, is usually a successful method, if moisture is present; but a press-shoe-drill seeding about an inch in depth, would be an ideal method of seeding broadcast fields for hay production.

5. Ten to twelve pounds of first-grade seed is plenty to sow per acre; that will be at least fifty seeds per square foot, which will be ample if conditions are right. Thorough preparation is cheaper than twenty to thirty pounds sown where the conditions are uncertain.

6. Sow with a nurse crop only when there is plenty of water for irrigation. Oats, barley, and wheat are good nurse crops, but should be sown at least two-thirds of a usual seeding for grain.

7. Spring seeded nurse crops should be cut for hay, rather than left to ripen for grain, as the young alfalfa will usually suffer for water before the grain is ripe and the field cleared and irrigated.

8. On land inclined to blow, sow alalfa in grain stubble without plowing. The stubble checks the wind and does not rob the plant moisture.

9. Irrigate often, and do not fail to irrigate in late summer and fall, if you want the best results from your stand of young alfalfa.

10. Keep down the weeds. Better seed alfalfa on clean land, but cut off with a mower if the weeds get started. Do not clip alfalfa until the crown buds have developed. Grasshoppers often injure a stand of alfalfa by eating off the leaves and top before the buds have started at the surface of the ground. Early seeding is preferred on this account. —Philo K. Blinn, Alfalfa Specialist, Colo. Agri. College.

Description of Tree Ideal Type

Other Notes

Mr. A. D. Shamel, of the Department of Agriculture is now in Riverside conducting investigations as to the production and quality of various citrus trees. The above sheet is one used on one tree. It will be noted that this is an "Ideal Type" tree. It will also be noted that it produced this year 816 fruits 802 of which were "Orchard" or first grade fruit. The next division below gives the number of each size of fruit while the next two divisions give the weight of each. There are four other columns for the following 4 years and a wider column at right for record of weather conditions or any event which may cause a large proportion of low grade fruit from causes not the fault of the tree. When complete a five year record of the tree's performance will prove valuable and may lead to pedigreed orange trees.

New Type Vertical Pump

Does It Not Seem Reasonable

To Assume That a Company

Portable Automatic Derrick

WHAT IS IT?

The greatest time and money saver on a farm. It is so handy you can use it for anything you want to hoist.

Last season Mr. H. C. Porter of Alpaugh, Calif., saw our ad in the California Cultivator and, after securing descriptive circulars and prices, he ordered one of our Medium Derricks. The following letter indicates that he is well pleased with the Derrick:

ALPAUGH, CALIF., Feb. 18th, 1911.
SCHMEISER MANUFACTURING CO., Davis, Calif.

GENTLEMEN:—Please send circulars describing your Portable Automatic Derrick to the following:

H. H. Cathcart — Jacob Sonke — J. A. Callister
A. D. Overman — A. B. Ward — F. N. Beason
Ernest Shields

—All of Alpaugh.

Some of them have used my Derrick and all have seen it work and think it is alright. They have alfalfa and need one. I am more than pleased with my Derrick and, with labor scarce and high priced, it is a great saving.. If you wish, I will act as your agent here and try to sell some Derricks.

Yours respectfully,
H. C. PORTER.

We want your name and address if you are a grower of alfalfa or any other kind of hay, so that we may send you circulars describing our Portable Automatic Derrick, a money-maker for you.

A Study of Bud Selection With Citrus Fruits

Address by Mr. A. D. Shamel Before Citrus Growers Convention at San Bernardino. An Outline of Work Begun Which Should Mean Great Increase in Worth of California Citrus Orchards

I came to Southern California for the first time in March, 1909, at the suggestion of Dr. B. T. Galloway, chief of bureau of plant industry, to study the methods of investigation of the handling and transportation of citrus fruits in charge of G. Harold Powell. In order to utilize this time of study to the best advantage, I was given actual work in the field experiments under Mr. Powell's direction, for the main part in assisting Mr. G. W. Hosford in the lemon handling experimental work which was being carried on in several representative citrus sections of Southern California.

In the course of this work, it was necessary to visit citrus groves, in order to secure fruit for experimental purposes. As I had been engaged in plant breeding work for eleven years previous to coming to this state, it was natural that the trees should attract my attention, particularly the comparative habits of growth, character and amount of fruit, and foliage characteristics of the individual trees. It soon seemed apparent that there was great diversity in regard to these characteristics of trees in the same orchard and under similar conditions of culture. Even with my inexperienced eyes, I could see plainly that trees of the Washington navel orange, for instance, of the same stock and under similar conditions so far as could be judged, varied widely in the amount and quality of fruit borne by the individual trees. Inquiry developed the fact that in the opinion of many of the growers questioned this variability of yield of individual trees was an established fact, but there was a probability that the large yielders of the season of 1909 would be the small producers of 1910.

One of the pioneers in modern citrus culture and a leading citrus grower of Southern California, Mr. E. A. Chase of Riverside, stated to the writer that he believed that there existed in his citrus groves, consistently good and consistently poor bearers. In support of this idea, Mr. Chase had studied his groves from this standpoint and was then in the process of rebudding a considerable number of what he considered to be undesirable trees.

After talking the matter over with Mr. Powell, I was asked to lay out a practical plan for the investigation of this problem. The plan was drawn up briefly, in the light of the conditions, was approved by Mr. Powell and through him arrangements were made to undertake a serious study of this subject in the field under the direction of the office of pomology.

I came to Southern California with the idea of staying not longer than three months. I have now decided to make this state my permanent home in order to more effectively prosecute this work, and because I like to live here.

Bud Variation.

Our definite beginning of the study of bud variation and selection was begun with the season of 1910, so that we now have one season's complete data and part of another, together with photographs and notes on the Washington Navel orange and Marsh's Seedless grape fruit. It was found impossible to undertake this work with other citrus fruits, such as lemons, although there has been an insistent demand on the part of a number of lemon growers for us to do so, without assistance. The securing of the data is tedious and the amount that one person can accomplish is limited. An effort has been made to secure help to take up work with lemons along this line, which if granted, will enable us to begin such work the coming summer.

Merely Preliminary.

Of necessity, the problem is one which requires time and patience. In the opinion of most growers and others, at least five years data must be secured before definite conclusions can be drawn. It seemed to me hardly advisable to present this paper now in view of this fact, and I have only done so at the urgent request of Mr. Hosford, who tells me that it will be understood that it is a preliminary paper, outlining our plan of work, rather than the announcement of results or hoped-for results. I do not wish to prejudice our work with thinking citrus growers or others, by any premature conclusions, or to influence anyone to think that we are drawing conclusions not warranted by adequate data and observations. With this understanding, I will attempt to briefly outline our object and plan of work in the study of bud variation and selection.

Object.

The object of our work is to determine the yielding habits of individual citrus trees under similar conditions. If we find that there is a consistent variation in yield of trees of the same variety under as nearly like conditions as can be found in our groves, it will be determined whether these variations, particularly yielding habits, can be propagated by bud selection. If these characteristics can be propagated, so that they appear fixed under different conditions, that is to say, when grown in different groves, it will be reasonable to conclude that the variations are due to bud variations, and not to local soil, climatic or other causes. In other words, the object of this work is to secure the performance record of a large number of citrus trees under comparative conditions, and to test the possibility or practicability of transmitting tree characteristics by bud selection and propagation.

Plan of Work.

The plan of work under which we are carrying out this investigation is not fixed, but so arranged that we can modify it, in the light of accumulating experience. It may not be the best plan even for a beginning, but it is the best and most practical for securing valuable data, that we were able to devise, in view of lack of precedents to guide our steps.

Location.

In view of the limited amount of work that one person can accomplish with the degree of accuracy and care needed for permanent data, it was decided to locate this first work in a typical section for a given variety or kind of citrus fruit, so that the results would be secured under typical conditions, and if valuable, could be utilized in a practical way at the earliest possible moment. After consultation, it was decided to begin work with the Washington Navel orange, and after several months of study of different localities, it was decided to locate this first study on the Eureka ranch of the National Orange Co., of Riverside. Through the active co-operation and assistance of the owners of this property, arrangements were made to secure performance records from carefully selected plots, and from individual trees in this orchard.

Varieties.

The Washington Navel orange was selected for this first work, for one reason, that the history of its introduction is well known, and it is an established variety of world-wide reputation and importance. It was found possible to undertake work with the Marsh's Seedless grapefruit variety, in addition to the Navel orange, as the pomelo fruits are naturally picked at such time as not to interfere with the Navel orange picking.

Selection of Plots.

The Eureka grove is nine years old from transplanting and the trees are apparently more uniform as a whole, with regard to yielding behavior at least, than any grove of Navel orange trees that I have visited. The grove is free from scale, has never been injured by cold or other seasonal causes, and the soil conditions are very uniform. The fertilization of the grove, and other factors of culture are known, since the planting of the grove, and before planting the soil had not been cultivated. The reputation of the high quality of fruit from this grove is established. The trees have not been pruned other than the usual removal of dead wood, and are in good healthy condition. These factors are extremely important for the true interpretation of results, and I feel that we have been extremely fortunate in being able to begin work under such favorable conditions. Another fact of some importance, is that in future announcement of results, it cannot be said that they were secured where the trees were notoriously variable from mixture of stock, or other cause, as this grove, as has been stated, is unusually uniform, due in part at any rate, we believe, to the more than ordinary care used in selecting buds for its propagation. Two typical plots of fifty and fifty-five trees respectively were selected by the owners and myself for plot data. In addition many individual trees were picked out for special study. About one hundred more trees were selected on the Vivienda ranch, near the Eureka ranch and belonging to the same owners, for comparative data. Particular pains were taken in these selections, especially to eliminate all possible outside influences, such as wide rows, missing trees, unusual amounts of irrigation water and other supposedly influencing factors in tree variations.

Recording Individual Tree Data.

Our first consideration in securing definite data of the variation of individual trees is the amount and quality of fruit. By amount is meant the total yield in pounds of fruit from each tree, and by quality is meant the proportion of first to second or third grade, and the proportion of the different sizes of fruits. In other words, I have called it the fruit's commercial quality. Necessarily each tree is picked separately in order to secure this data. The second part of our data consists of photographs, one taken of each tree before it is picked and one after picking, with the boxes of fruit that the tree produced arranged at the base of the tree, in order to give a graphic illustration of its yield. The third part of our data is made up of written notes, descriptive of characteristics that are not brought out in our yield data or our photographs. In securing this data on the Eureka and Vivienda ranches, I have had the constant co-operation of the owners of the orchards, particularly Mr. H. B. Chase, who has performed no small part of the work.

After picking, the fruits from a given tree are graded and sized, each tree separately. This work is greatly simplified by the use of a small mechanical grader, the suggestion of Mr. Frank Chase. Three grades are made, a first which we call orchard, a second which we call standard, and a third, culls. In the orchard grade, all of the sound unmarked fruits are placed. In the standard, marked but commercial fruits fit for shipping, are included, and in the culls the fruit not fit for shipping. The culls are not sized, but counted and weighed collectively. After grading and sizing the fruits in each lot are weighed and counted and the weights and numbers recorded in our blanks which we call our orange performance record blanks. Later this data is transferred to sheets providing for the recording of five years data from each tree, together with the photographs and descriptive notes.

Our grapefruit work is being done on the Dixon ranch of L. V. W. Brown

LARGEST CITRUS NURSERIES IN THE WORLD

Parties contemplating the planting of citrus groves this coming spring will do well to send for our prices soon, as there will evidently be a shortage of strictly first class stock. Write today for particulars, or, better still, pay us a visit so that we may be able to show you just what we have.

Our finely illustrated booklet, "Citrus Fruits," covering the industry from the seed to the market, mailed to any address on receipt of 25c in stamps.

of Riverside, and the Mutual ranch of the National Orange Company, at Corona. Similar work with individual grapefruit trees, to that of individual orange trees, is being carried on, and one season's data has been secured from seventy-five trees.

Propagation Work.

A limited number of sweet orange seedlings, in the nursery belonging to the late C. E. Rumsey, of Riverside, have been budded from select orange and grapefruit trees. Also on the Eureka ranch some of the poorest yielding trees have been rebudded with buds from the best yielding trees and vice versa. It will be necessary to wait until further performance record work has been done in order to do further bud propagation work intelligently. At the same time, it is desirable to do as much of this work as practicable, at the earliest possible moment, in order to secure information on this most important phase of this work.

Some Preliminary Observations.

We have found, so far, a tremendous and to us unexpectedly great variation in the yield and quality of fruit from comparative trees. It must be kept in mind that these results were obtained from normal healthy trees. In one case we secured from one tree, in 1910, 14 inferior fruits weighing 6 pounds and 15 ounces, while in the same plot a neighboring tree produced 541 fruits weighing 233 pounds and 9 ounces. Another tree produced 816 fruits weighing 432 pounds. The yields are comparatively the same this year as last season. These are extreme, but typical examples. In the grapefruit plots even greater extremes were observed.

In other words, the trees we are studying varied greatly, much more than had been heretofore supposed. The largest yielding trees invariably have produced the best fruit, not only the largest proportion of first grade or orchard fruit, but the largest proportion of larger and more valuable sizes, such as from 150s to 96s, inclusive. The poor yielding trees have produced the extremes, either very small or very large fruits. Such results are contrary to the generally expressed belief to me of growers before I began this work.

Our large yielding trees of the season of 1910 are our large producers in 1911. While these trees are producing more fruit than last season, they are yielding proportionately about the same, in comparison with the poor trees of last season. The only marked difference has been found where some of the poor trees have failed to show much, if any, comparative increase. This is contrary to many opinions expressed to the writer. Some of these observers had concluded that the large yielders of one season were the poor yielders of the following season, and vice versa.

We have found many interesting sports or mutations, both in the branches of trees, of single fruits, and as entire trees. Some of these have been budded from, not in the hope of producing a better orange than the Navel orange, but in the hope of throwing some light on the origin of varieties of the Navel orange. Numerous interesting observations have been made as the field work has progressed, but in this paper it is not possible, or important perhaps, to speak of them.

Possible Utility of Citrus Bud Selection Work.

If the results of the past work are confirmed by future work, it will demonstrate the importance of propagation from scientifically selected citrus trees. By securing trees propagated from parent trees of known and demonstrated high productiveness and the ability to transmit this quality, the grower will be able to greatly increase the productiveness and value of his land. The elimination of the poor bearing trees in our present orchards, constituting, I believe, not less than 10 per cent, probably much more, would go far towards improving this industry. In securing reliable, pedigreed trees, new planters could prevent the loss due to the culture of barren and worthless trees. Two possibilities present themselves to my mind, if our work is confirmed, namely, the rebudding of poor trees in our present orchards, and the planting of uniform groves of reliable trees in the case of new planting.

While we cannot prophesy what will occur in this connection, and I have no desire to do so, such a consummation is not unnatural to expect. It is strictly in accord with our experience with other plants, such as corn, tobacco and seed-bearing plants which have been greatly improved by seed selection. Variation is the rule in nature. We have bud variations in the case of citrus fruits, the extent and character of which, however, I am uncertain about. What more natural than that we should have buds producing trees that from some cause, perhaps the development of large amounts of fruit-bearing wood in proportion to foliage-producing wood, are more suitable for our highly specialized uses than others. If so, it will be strictly in accord with our investigations and plant-breeding experiences. We hope that these investigations will throw some definite, practical light on this important subject to citrus and other fruit growers.

I would like to emphasize the importance, to my mind at least, of fruit growers making a careful study of the individual trees in their orchards along this line. It may not be practicable to study many trees, and this is perhaps unnecessary. If a few carefully selected trees were studied, it would not only be a pleasant occupation to most growers, and I believe for their own benefit, but might add to the progress of the accumulation of information on this subject by others. Not only do I firmly believe this, but, further, that, unexpectedly perhaps, valuable new strains of fruits might be produced from select trees. We cannot tell where one may find a valuable sport or mutation. It has frequently happened in the case of other fruits and plants that our most valuable varieties have originated under what are ordinarily considered most unpromising conditions. I will venture to recommend this work to all those who are interested in botany or horticulture, as a most promising field for study, and a most pleasant and interesting occupation for those who love the outdoors and the contemplation of growing plants. In this connection, I will be glad to furnish samples of our record-keeping blanks to all who desire them.

Citrus and Tropical Fruits

INFLUENCE OF STOCK.

Touching upon the communications received in answer to Mr. Blanchard's query a few weeks since, Mr. W. C. Hewitt, a valued subscriber of the Cultivator in Florida writes enclosing us a letter from the late Rev. Lyman Phelps of Sanford, Florida. This letter which touches upon the influence of stock on fruit was one of the last written by Mr. Phelps. He was an authority upon citrus matters in Florida, and being a wealthy man, devoted much of his life to experiments in citrus fruit culture. He was a very careful worker and never gave out statements as to his determinations until he had tested them for many years. Mr. Hewitt writes:

"Your paper is a welcome visitor in Florida where we have charge of a thousand-acre grapefruit grove. We miss the dear old hills of California and some others of its blessings. Messrs. Burton, Harnass, Cook and Carr, all Californians, are located near me and doing good work." Mr. Phelps' letter, written more than a dozen years since, touching upon stock influence follows:

"The sour orange as a stock with Villa Franca or Messina or Communis worked on it or any other good quality of lemon, and orange worked on this, increase the quality and quantity of the fruit. You increase the quantity of fruit by using the wild lime (vulgarly called rough lemon), but lose in quality as a stock. It is, however, a very hardy stock, free from most diseases—all my experiments verify this. I do not pretend to understand it and we know yet very little about the how of things—the evidence of our senses when we see things we cannot get away from. Since the freeze there has come up a lemon simple and pure, and a sour shoot from the stock of an older sweet tree—there was standing 33 1-3 feet away a sour stock on which was worked a Communis lemon—and on half of this lemon when it forked was worked a Maltese oval orange, and this Maltese oval part was always loaded with fruit and fruit of finer quality and bouquet than I ever saw elsewhere, with thin, soft skin. Then again, when we came to cut down trees killed we have found the bud variety had grown down in some cases 18 inches over the stock—how, we do not know. Last spring I set some variegated orange buds six inches from the ground. About the identical time the bud began to grow there started a shoot on opposite side of the stock in every way identical with the bud, just at the collar of the stock—it stands today to be seen of all men, but only a very shallow man would attempt to say he could see how it was. We know very little of how the stock affects the fruit of the new bud or graft—only it does—and the more we experiment the less we try to explain."

NITRATE OF SODA, 65 POUNDS TO TREE.

Adding, if I may, to your answer to question in your issue of 2nd inst., under heading "Nitrate of Soda," I beg to say that I know of the application of 65 pounds of this salt at one time to an orange tree just to see if it would do harm. The only difference noted between this and the other trees was that this one outgrew the others. But no one advises such applications, as it would be a sheer abuse of a good thing (and a sheer waste of good money, besides from Dr. King's standpoint increase the soil content of sodium carbonate or black alkali.—Ed.)

Would it not be well to make the early application a little larger than the others, since in the warm season nitrification of the soil nitrogen is more active, rendering this source of nitrogen more available.—R. R. Snowden, Chemist and Soil Engineer.

POTASH SALTS.

The present discussion regarding potash gives interest to any available facts and figures concerning potash salts. These salts are discussed in a report just published by the United States Geological Survey as an advance chapter of its volume, "Mineral Resources of the United States, Calendar Year 1910." According to this report, which was prepared by W. C. Phalen of the Survey, all potash salts of mineral origin now consumed in the United States are imported, chiefly from Germany.

A Big German Deposit.

The principal source of the German potash is an enormous deposit at Stassfurt, which, at the present rate of exploitation, will last, it has been estimated, about 600,000 years. The report describes this deposit in general, sketches its probable mode of origin, and gives lists of the minerals it contains.

Potash Has Many Uses.

Many kinds of potash salts are imported into the United States from Germany, where a score or more of mines are in operation. These salts are used for many and diverse purposes—in gold mining, glass making, soap making, bleaching, dyeing, photography, medicine, in making explosives, in fertilizers, and in many other ways.

Imports Worth Eleven Millions.

The value of the imports of potash in the fiscal year 1910 was more than $11,000,000, and the imports have been increasing at a rapid rate from year to year.

Potash in the United States.

Potash is an abundant constituent of many rocks and minerals found in the United States, and experiments have lately been made to devise means of profitably extracting it from the rocks. The waters of some western lakes, as Owens and Mono lakes, California, also contain potash, and indicate that the beds of evaporated lakes in the desert regions of California and other states may include large amounts of potash. Potassium nitrate has been found in the desert region northeast of Salton, Cal.

Deposits of rock salt in Michigan are also of interest in this connection. The red beds of the southwestern United States contain deposits of gypsum and rock salt, and may be possible sources of potash salts. The report suggests that these beds might profitably be explored in places where conditions favor the accumulation of such salts.

Potash may be derived from organic sources, as from wood ashes and sea weed. The giant sea weeds of the California coast contain potash salts, but no experiments have yet been made to recover them on a commercial scale.

FARMOGERM

High-Bred Nitrogen Gathering Bacteria Increases Crops and Makes Poor Soil Good Soil

You will surely plant some of the crops known as legumes, such as garden and field peas and beans, alfalfa, all the clovers, alsike, vetch, etc. With all these crops you may use Farmogerm. And that will mean not only a bumper crop this year, but soil so rich in nitrates that it will produce several big yields of any crop without more nitrogen fertilizer being needed. Because Farmogerm inoculates the soil with nitrogen-gathering bacteria of strong vitality, specially bred up to a high state of nitrogen-fixing power. They increase rapidly in the soil and plant roots, by the millions, and draw nitrogen from the air, feeding it to the growing crop and storing it in the soil for future crops.

Farmogerm will cut your fertilizer bills in half. A trial will prove our claims. It is no experiment. Let us send you letters from those who have used it and **know**. High authorities recommend it. It is **guaranteed** to be right. It is **Ready For Use**. Just mix with water and moisten seed or spray over soil or young plants. It insures larger yield, greater food value, earlier maturity. When ordering, state what crop you want to test.

Acre Size, $2.00—Garden Size, 50c.

Why spend money for expensive nitrate fertilizers and for spreading when you can put more nitrates in your soil than crops can use in several seasons at the low cost of $2.00 an acre and practically **no extra work.**

WRITE TODAY FOR BOOK. AB You have nothing to lose and perhaps hundreds of dollars to gain through a better and more economical method of fertilizing. This is the most wonderful development of modern scientific farming. Investigate—that's all we ask.

EARP-THOMAS FARMOGERM CO.
Bloomfield, N. J.

Better Than Nitrate of Soda

at fraction of cost and labor. According to Government figures, a crop well inoculated with nitrogen-gathering bacteria will leave in the soil, for future crops, an amount of available nitrogen equal to from 800 to 1,000 lbs. of nitrate of soda. Yet the soda would cost you $20.00. The Bacteria will cost you $2.00. Which for you?

Citrus and Tropical Fruit Trees

5000 Eureka Lemon trees
5000 Valencia Late Orange trees
5000 Navel Orange trees
3000 Grafted Walnut trees

People who intend to plant lemon or grafted walnut trees this season will have to secure them from some source early as they are now very scarce.

Deciduous Bush-Tree Fruits

INTERESTING EVENT IN FIG GROWING.

The writer of this has a fig tree of the species Pseudo carica, which about four years ago was planted in the backyard. It grew very vigorously and has been setting an immense lot of fruit very early in the spring, but to his disappointment every one of them dropped. The tree is now four years old and of considerable size. Last fall Dr. W. F. Swingle and Prof. Mason of department of agriculture, noticed this tree and inquired as to the cause of fruit not maturing. Mr. Swingle said that he would send me some Blastophaga which I should liberate in the tree. This was done in November, and only a single fig has been colonized. I sent some specimens to Mr. Rixford of San Francisco, and he says they appear to be of the Profichi crop, and the new crop coming on is of the mammoni crop. The larger specimens were full of galls with Blastophaga in the larva stage. He also states that he thinks it is the first time that this species has been colonized in the New World.

The writer has about seven of this kind of fig trees and they are setting an enormous crop of mamme figs. Several unsuccessful attempts have been made by the writer and this is the first colony established in Imperial valley. We have been planting several thousand Smyrnas in this valley and inasmuch as our season is so much different from the other parts of this state, it was impossible to secure Blastophaga and it will be intensely interesting to see the results of this useful insect.—Francis Heiny.

* * *

Mr. G. P. Rixford of San Francisco comments on Mr. Heiny's letter as follows:

The fig mentioned in Mr. Heiny's letter is Ficus pseudo-carica, a native of Abyssinia. A few specimens are scattered about the state, but it is not grown in any considerable numbers, as little is known about it. It is growing at Santa Barbara and in the United States experiment orchard at Chico. The tree is a vigorous grower with deeply lobed, acuminate leaves; fruit of medium size, coppery brown in color and very sweet.

In a letter dated El Centro, October last, Mr. Walter T. Swingle wrote as follows: "I visited Mr. Francis Heiny of Brawley yesterday in company with Prof. Mason and we were surprised and gratified to see that he has a large tree of Ficus pseudo-carica from Abyssinia and that it is a male tree. It shows small points, so I think the chances are good to establish the Blastophaga there now. If possible send him some from Loomis, Fresno or Niles."

In accordance with the above I sent a few late mammoni figs from Niles and San Rafael. The season, however, was so far advanced that the caprifigs sent were in poor condition, but it appears that the Blastophaga they contained entered the young figs on Mr. Heiny's trees and are now established. It remains to be seen whether they will perpetuate themselves by entering the next crop.

Dr. Franceshi of Santa Barbara writes under date of Feb. 24 as follows: "You will certainly be glad to know that some results were obtained through the intervention of the Blastophaga kindly forwarded by you, on both my specimens of Ficus pseudo-carica and Ficus sp. from Cabul.

"I have not as yet obtained any fruit fully developed and fit to eat, but I have gained this, that both trees are loaded now with small, but healthy and sound fruits, promising to come to maturity, while in the years past, all figs formed in the fall invariably dropped during the winter."

While the specimens sent by Mr. Heiny had all the characteristics of profichi and mamme, their appearance is so out of season that except for their great abundance, both at Brawley and Santa Barbara, they might be mammoni and mamme.

The important point, however, in this matter is that Blastophaga is established in Imperial Valley where thousands of Smyrna figs have been planted with no possibility of fruit unless fertilized with insects from outside sources. The writer has on account of the U. S. department of agriculture forwarded many caprifigs to different growers and this is the first instance that has come to his notice that the insect had been established and this time in the Abyssinian species, which is quite different in several respects from our common figs. Another important point brought out is the extreme percociousness of these pollen bearing caprifig, which may be used to caprify very early figs of some varieties that are now lost. It is also contended by many observant growers that pollination hastens the ripening of Adriatic, Mission and other figs of that class by from a week to ten days. This species may therefore be the means of giving earlier fresh fruit and of considerably extending the fig season.—G. P. Rixord.

SETTING QUICK GROWERS BETWEEN.

The question is often asked as to growing garden or field crops or quick growing orchard trees between walnuts or other trees set far apart. It is usually done and if care is observed, without injury. We note a suggestion in the Country Gentleman which may be of value as a suggestion. The plan may be varied to suit circumstances.

"If the trees are set according to this method, and at a distance of 36 feet apart, there will be 33 trees to the acre. That is, there will be just as many as there would be if the straight-line method were used. Of course, if a single acre is set, and if it happens that this acre has some irregular form, the planting may not come out an even 33 trees. The reservation of a 12-foot strip around the outside might make a difference, but the amount of the difference would depend upon the form of the tract, or whether it was an exact acre or more or less.

"The accompanying diagram shows the diagonal method of planting trees

tory. Where fillers are used, it is customary to place them not only in the rows between the apples, but in the space between the trees in the rows. Where the orchard is completely filled in this fashion, the number of fillers will be exactly three times the number of permanent trees. That is, if the permanent trees are 36 feet apart, 33 to the acre, the number of fillers will be 99 per acre. This arrangement is largely practiced even where the fillers are apple trees instead of peach trees.

"A great deal has been said against the filler system of orchard planting, but it has been almost universally adopted by modern and up-to-date men."

PLANTING PECANS.

Pecans seem to do well on soil of practically any texture, so long as it is fairly well supplied with plant food. They are a difficult tree to get started to growing, and if no more care is used in transplanting them than is usually exercised in the setting out of fruit trees, a large percentage of them will fail to grow. The sun should never be allowed to shine on the roots, and the tree should be thoroughly watered while being set out, after the hole has been about two-thirds filled with dirt, and more water applied after the work of transplanting is completed. The earth should be thoroughly packed around the roots. Some nurserymen recommend that the soil be carefully worked around them by hand; and it will probably pay to do this. Any injured roots should be cut back or removed, and the top of the tree should be pruned rather severely.

Regarding the distance apart to plant the trees, this cannot be stated definitely at this time. However, it is thought that forty feet apart is about the proper distance. Some of the Southern orchardists consider this rather close; but it is not certain that as large a growth will be made in this section as in the South.

The cultivation that is ordinarily employed in good orchard management will give satisfactory results, no doubt, with pecans; except that the irrigations, during the first two or three years, at least, should be more frequent.

The pruning of this species should be such as to cause the scaffold limbs to leave the trunk three or four feet from the rground. There is difference of opinion among writers as to whether the branches should be cut back severely every year or two, as the tree grows older; but it is thought that the better plan is to do a little pruning after the head is formed. Merely cutting back a branch here and there occasionally, in order to keep the top symmetrical and well rounded, will be found to give good results.

Many authorities consider cross pollination a benefit during some years, so that it is advisable to plant more than one variety in an orchard.

Pecan trees grow slowly, and it is doubtful if many nuts would be secured before the trees were eight or ten years old. In this section it usually takes the trees three years after transplanting to reach a diameter through the trunk of one or one and one-half inch. Owing to this slow growth, they should be secured from a nursery that is entirely reliable.—C. P. Wilson, New Mexico Col. of Agr.

MEASURING WATER.

With new subscribers coming and with old subscribers forgetting or losing valuable numbers of the Cultivator there is occasional demand for repetition of good things. Construct ing a weir box, and the measuring of water is one of them, which we have been asked to repeat or send back numbers. In this case the back numbers are entirely exhausted, so we repeat from a year ago, directions for making a Cippoletti weir and table used in measuring cubic feet per second.

The acre-foot is, of course, 43,560 cubic feet, which is approximately twelve hours' run of a second-foot.

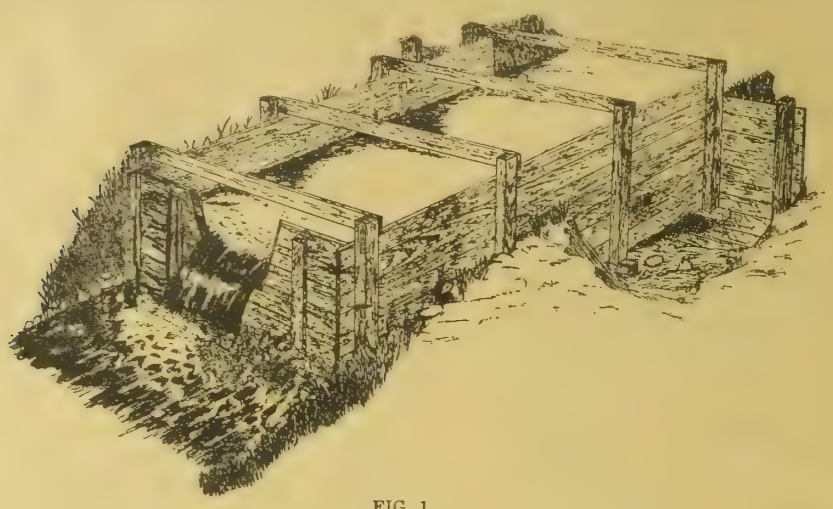

FIG. 1

The Measuring Weir.

The means best adapted for the accurate measurement of moderate amounts of water with the least trouble and outlay of money after once established are the weir and the rating flume.

The first of these, the weir, is most limited in its application to different channels, but where it can be installed its use is attended by fewer inaccuracies in results and greater simplicity. The measuring weir is simply a notch of a certain shape and size in a dam placed across a stream, the arrangement being such that all the water flowing in the stream has to pass through the notch. By merely reading off on a scale in inches or feet the depth of water on the bottom of the notch and referring to a table computed for the particular size of weir, the amount of water in cubic feet per second passing over the weir can be immediately found. There are several classes of weirs known by the shape of the notch, as rectangular, triangular and trapezoidal. The last of these is the simplest, and is the one it is advisable to use in all cases where the weir can be installed.

The weir is the invention of an Italian engineer by the name of Cesare Cippoletti.

It may be explained that with the weir, the amount of water which will pass in a second is dependent primarily upon the area of the opening and the head of water upon it. It will be noticed in this that the opening, or notch as it is called, is of regular trapezoidal form; that is, the top and bottom are horizontal, and the sides slant at a certain angle with the vertical. The notch is shown more in detail in figure two. The line BC is called the crest of the weir, and the slope of the sides, AB and CD, is one inch horizontally for every four vertically. The length of the weir is the length of the line BC, thus in a two-foot weir the line BC is two feet long.

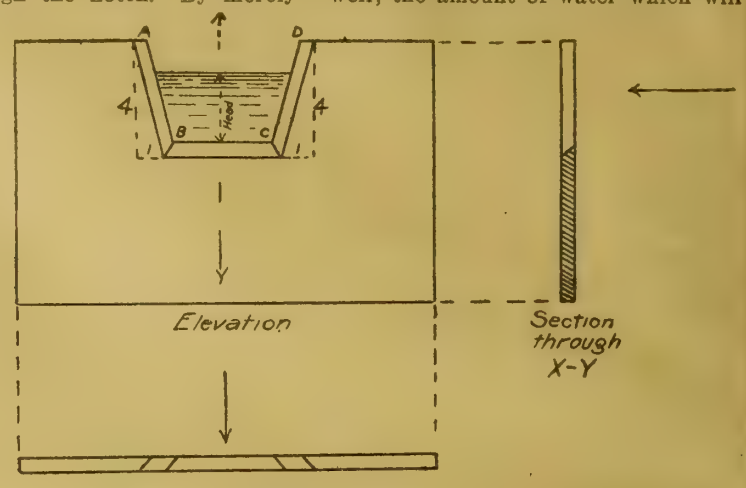

FIG. 2—Detail of Construction

As shown, the notch is chamfered so that a sharp edge is left on the up-stream side. This detail is very important, as upon it depends, among other things, the accuracy of the measurement. That the use and installation of the weir may be made perfectly clear it may be best to take a concrete case for illustration, giving the design of a weir and showing how to place it.

The first point to which attention must be given is the probable maximum amount of water that will pass over the weir. An estimate may be made upon the amount of land to be irrigated, allowing one cubic foot per second for every 70 acres. Let it be supposed that we have some 200 acres to irrigate. About three cubic feet per second will then be the largest amount of water required.

Certain rules have been laid down which must be observed in determining the dimensions of weirs if the results are to be accurate. They are viz.:

1. The greatest depth of water which should be allowed on the crest of the weir should not be more than one-third, or better, one-fourth the length of the weir, and the least depth three inches.

2. That the distance from the crest of the weir to the bottom of the weir box should be at least three times the depth of the weir.

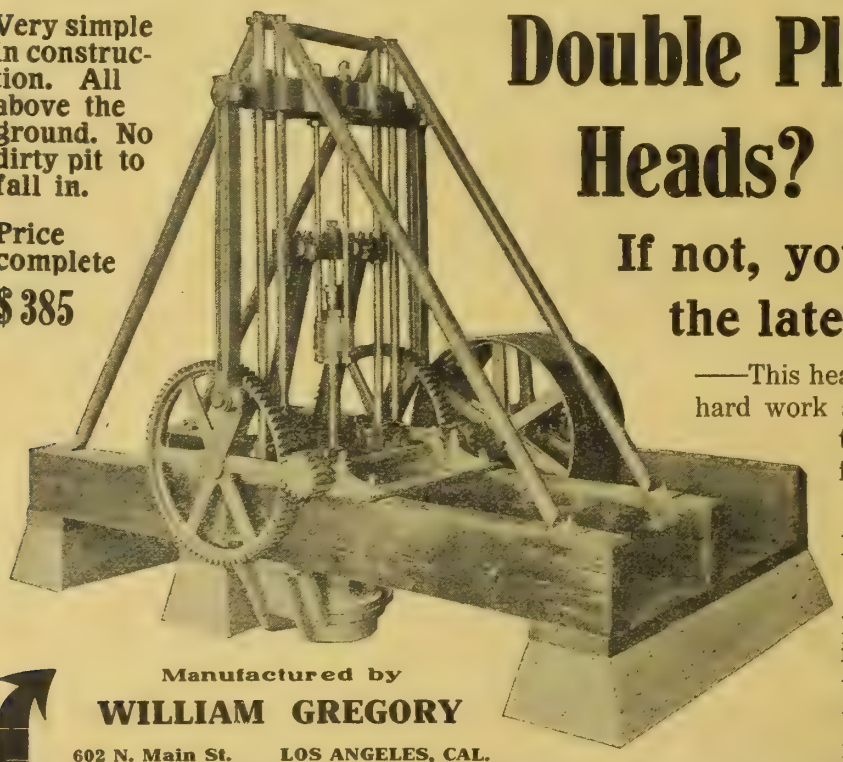
3. That the distance of the crest from the sides of the weir box be at least twice the depth of water flowing over the weir.

These rules are intended to eliminate an inaccuracy due to what is known as velocity of approach. It can be seen that if the water in a stream approaches the weir with considerable

Have You Seen GREGORY'S Deep Well Double Plunger Power Heads?

Very simple in construction. All above the ground. No dirty pit to fall in.

Price complete $385



If not, you have not seen the latest in power heads

——This head is the production of years of hard work and careful study and is made to meet the demands of the California rancher.

Chicago Office, - - First National Bank Building.

velocity, that the velocity of the water passing through the weir notch will be much greater than if the water behind the weir had been comparatively still. It is for this latter condition that weir formulas have been worked out, and consequently if there is considerable velocity of approach the weir formula cannot be used unless some correction is made for the increased discharge due to the increased velocity with which the water passes over the weir. The rules given above will be found by computation to provide a section of channel above the weir with area equal to about eight times the area of the weir opening. Consequently the velocity of the water in the channel behind the weir would be about one-eighth the velocity of the water passing through the notch. If this ratio is not exceeded no correction need be made for velocity of approach. It is always advisable, therefore, in placing weirs to see to it that the channel behind the weir is large enough to make the velocity of the water as it approaches to flow over the weir so small that the error will be insignificant.

Applying the above rules to the case in hand, we find first by rule 1, and by referring to the weir tables given that the length of the weir for a discharge of 3 cubic feet per second should be two feet, this giving a depth of about seven inches on the crest.

The depth of the weir notch should be from one and one-half to two times the greatest depth which is to be allowed on the crest of the weir, which would make the depth of the notch in this case about 12 inches. Allowing a depth of notch of 12 inches and a depth of water on the crest of 7 inches, we find by rule 2 above, that the total depth of the weir box should be 2 feet 9 inches, or three times the depth on the weir plus the 12 inches due to the depth of the notch.

The width of the box should be four times the depth on the crest of the weir, plus 2 feet, (the width of the weir), which gives 52 inches as the total inside width. The length of the box is not of so much importance unless the channel of the ditch or canal is contracted, tortuous, or both, immediately above the weir. In any case, however, the length of the weir box should be not less than 6 or 8 feet.

The construction of the weir box is shown fairly well by figure 1. The material should be 2-inch lumber for the body of the box and end. The frame should be 2 by 4 inch timber. Lumber which has been well seasoned and is free from knots is desirable. The weir shown in the cut has an apron on the sides and bottom. There is always a necessity for this apron when the weir must be placed in soil which cannot be puddled or tamped about the box to prevent the water from finding a way under or around it. Burlap nailed to the bottom and sides of the box, secured to the sides and bottom of the channel with pegs and then covered with dirt, makes an excellent apron as the soil is caught in the meshes of the burlap and held there, making it almost waterproof.

The opening should be very carefully made. If the weir is to be two feet wide, the breadth of the bottom of the opening or crest, as it is called, should be just two feet, after it has been beveled. The sides should slant at the rate of one inch horizontally to every four vertically and should also be beveled with the sharp edge upstream. If the opening is 16 inches

deep and the crest is two feet wide, the width of the opening at the top should be 2 feet 8 inches.

As previously stated, the weir is not applicable in all cases and considerable care should be exercised in placing it. The usual and best situation for a weir is in a straight portion of the channel where the banks are high and the fall considerable. In every case it is not possible to find such conditions naturally, in which case the ditch banks above the weir for some distance may need to be strengthened, so that the water as it backs up to flow over the weir may not break the banks. If the channel is narrower than the weir and tortuous, it should be widened to the width of the weir and straightened upstream for about 100 feet.

The weir box should be set level both ways and the crest of the weir should be perfectly level. This last condition, of course, may be tested when the water flows over the weir. It will be noticed in the sketch that there is a scale placed some distance back from the weir, the object of which is to determine the depth of water flowing over the weir. The reason for its being placed so far back from the crest is that the water, as it passes over the crest, lowers the level of the surface from a short distance back from the weir so that if the depth of water is read on the crest of the weir itself, the head will be too small and the measurement will be inaccurate. The zero point of the scale, which may be marked in tenths and hundredths of feet, or in inches and sixteenths, as desired, should be on an exact level with the crest of the weir. If the zero point of the scale is placed even with the surface of the water at the instant that it commences to flow over the crest and then secured in that position by nailing or clamping, the depths can be determined quite accurately. The scale should be placed at least three feet back of the weir.

Depth of Water on crest	1-foot weir	2-foot weir	3-foot weir	4-foot weir	5-foot 5-foot weir	6-foot 6-foot weir	7-foot 7-foot weir	8-foot 8-foot weir	9-foot 9-foot weir	10-ft. 10-ft weir

Use of Tables.

The depth of water on the sill or crest of the weir is measured in inches and eights some distance back of the weir to lessen the inaccuracy due to the surface curve. The depth may be determined with an ordinary carpenter's rule on a stake the top of which has previously been set on a level with the crest of the weir.

With the depth of water found we look in the tables and find the number of inches corresponding to the depth. Opposite these figures under the column indicating the width of the crest of the weir will be found the discharge in cubic feet in every second. It may be said in passing that by multiplying the discharge as found in the table by two, the depth in feet is found to which an area of one acre would be covered by such a stream flowing continuously for 24 hours.

"Why, a big fort," replied his father.

"Well, papa, is a ratification a big——"

"I am busy now, dear," replied his father as he escaped.—Ladies' Home Journal.

Live Stock and Dairy

Dairymen and stockmen are requested to write of their experience. Mrs. Sherman is always willing to answer queries and this, with experience of other workers, will make this department of greater value.

FEEDING THE DAIRY CALF.

An article in a previous bulletin of this series dealt particularly with substitutes for whole milk in calf feeding. It is the purpose of this article to present a brief review of the whole subject by D. H. Otis, of the Wisconsin Experiment Station. In the first place Professor Otis calls attention to the herdsman's responsibility in feeding and caring for the dairy calf. If the dams have been properly nourished the value of the calves at birth depends largely, if not entirely, upon the intelligence and skill exercised by the owner in their breeding. The future possibilities of the newborn calf, however, rest on the thought and skill that the owner puts into its feed, care, and management. Mistakes at this period of the calf's life are probably of lifelong influence, while a mistake in feeding and caring for a mature animal may be only temporary in its effects. Calf feeding requires skill and good common sense, as there are no hard and fast rules that can be laid down.

Young calves need whole milk for the first few days. The calf should always have the first or colostrum milk of the cow and be allowed to nurse the cow until the eighth or ninth milking, when the milk is suitable for human food. Feed often with small amounts to avoid overfeeding. Teach the calf to drink and feed whole milk for at least three weeks, changing to a skim milk diet gradually.

By good feed and care, or the lack of it, it is easy to make a variation of $1 to $5 or even $10 per head in the value of the calf the first year.

Skim milk is a cheap feed for calves but should be fed carefully in limited quantities and only while it is warm and sweet. Skim milk may form the principal diet of the calf for eight months or a year. Factory skim milk should always be pasteurized to avoid the spread of tuberculosis. The best skim milk is that which is fresh from the separator and still warm. Experiments show that it is only one-fourth as expensive to raise a calf on skim milk as whole milk. Two pounds grain with the proper amount of skim milk equals one pound of butter fat. Buttermilk or whey may profitably be fed to calves.

Milk that is too rich may cause serious trouble from scours, and in feeding such milk care should be exercised to give limited amounts at the proper temperature. The feeding of whole milk should be continued for about three or four weeks, when the number of meals may be reduced to two per day. From one-half to a pint of skim milk may now be substituted for an equal quantity of whole milk. The amount of skim milk may be gradually increased and the amount of whole milk correspondingly decreased until, at the end of a week or ten days, the calf is getting all skim milk. Feed the milk sweet and at blood temperature.

Not over 10 to 12 pounds of milk daily should be fed until the calf is 5 to 7 weeks old. Later the amount may be increased to 14 or 16 pounds and at three months may, though not always, go to about 20 pounds. The amount fed, however, must be carefully regulated by the ability of the calf to handle it without scouring.

The grain for calves should be fed first while the calf is quite small with a little bran to aid the calf in learning to eat. High-priced concentrates are unnecessary and give no better results than corn meal, oats and bran, ground barley, etc., when fed in proper combinations. At four to six weeks a calf has good teeth and can grind his own feed. A variety of feeds is advantageous and best results will usually be secured from mixtures.

The roughage for calves should first be fed at two or three weeks of age when the calf begins to eat grain. Good clean hay, either timothy, blue grass, clover or alfalfa may be used. Corn silage is an excellent calf feed when fed in moderate amounts. Good pasture is an essential after four to six months of age, and if the calf is turned out for only a few hours each day at first scours will be avoided.

Whey has the casein as well as the butter fat removed and hence is a much less valuable feed than skim milk; a good grain ration must be carefully selected as a supplementary feed. The calf to be fed on whey should receive whole milk for the first week or two; it can then be changed to skim milk. If this is not available it should be continued on whole milk. A calf will do better not to receive whey for five to six weeks. It will take ten days to two weeks more to complete the change to whey. Calves will handle about the same amount of whey as skim milk, viz., 14 to 16 pounds daily per calf. An excessive amount may cause undue largeness of the paunch. The feeder will need to give more care and attention to calves fed on whey than to those fed milk.

Calves, like other farm animals, get thirsty, even though milk forms a large part of their ration. Calves three months of age will drink as much as 5 quarts of water daily per head. They like to drink often, sipping a little at a time. A half barrel, cleaned and replenished twice daily, will serve nicely as a water trough. Another good device is an automatic waterer, which may be easily cleaned, situated a little above the floor to keep out the litter. Salt is essential to the development of the calf, as of other animals, and should be kept continually available.

The management of the calf during the first year has much to do with its later usefulness. Plenty of water and salt should be given in clean vessels. Avoid sudden changes of diet and practice regularity in feeding. Provide warm, dry quarters in damp weather. Give plenty of roughage and not too much grain so as to develop a large capacity for handling food as is desirable in dairy animals. When the calf is six months to a year old milk may be omitted from its ration and a full roughage and grain diet substituted.

When the skim milk diet is stopped at any time from 6 to 12 months of

$1000.00

A Manufacturer of Cream Separators, our "would-be competitor," has advertised extensively the following false statement:

"AN HONEST CAPACITY CREAM SEPARATOR."

"We make the claim that under any and all conditions a DeLaval machine rated at 450 pounds capacity will skim as much whole-milk in an hour as any "would-be" competitive machine rated at 600 pounds per hour, and we have proved this statement so often in actual contests that it has come to be an accepted fact by all well-informed dairymen."

So far as the United States Cream Separator is concerned this statement is **absolutely untrue.** We offer $1,000.00 to any State Dairymen's Association before whom the DeLaval can prove their claim.

The following facts are known world wide, viz:

That the United States Separators run their **full rated capacities, and more.**

That we Guarantee every UNITED STATES SEPARATOR to separate its full rated capacity.

That the DeLaval and other "would-be competitors" **have been beaten** by the United States **in capacity** as well as **in efficiency** in every National and International contest; at the Pan-American Exposition at Buffalo, in 50 consecutive runs, extending over 30 days with the milk of 10 different breeds of cows; at the Alaska-Yukon-Pacific Exposition at Seattle in 1909, where the United States was awarded the **only** Grand Prize.

In their efforts to overcome the superiority of the United States Separator, as demonstrated by the **recognized truths,** the DeLaval resort to extravagant and untruthful statements like the one quoted above.

The United States Separator excels in efficiency, and **all other points** that go to make a perfect cream separator.

Send for Catalog No. 20 now and nearn the full truth.

Vermont Farm Machine Co., Bellows Falls, Vt.

Distributing Warehouses in all Dairy Sections of the Country.

age, it should be remembered that the calf is deprived of a nitrogenous food and its place should be taken by some nitrogenous grain or roughage. The tendency of the dairy calf to get too fat depends not only upon its temperament but also upon its feed. Avoid too much corn. Grain, oats and barley are good; for roughage, bright clover or alfalfa hay with corn silage to give succulence and variety.

Size depends much upon heredity but even more upon liberal and judicious feeding. It is impossible to starve good dairy qualities into a growing heifer but many a promising heifer has been starved into a poor cow.

The intelligence that the herdsman puts into his calf feeding will have a great influence upon the future cow. There are great possibilities in the production of good cows but these are seldom if ever seen, appreciated, or attained except by an intelligent, thoughtful feeder. The earmarks of an intelligent feeder are seen in his herd. The calves are thrifty, active, with bright eyes, smooth, glossy coats, always hungry, and playful and lusty. —Farmers' Bul. 430.

KENDALL'S SPAVIN CURE

"ONLY SURE REMEDY"

Gadsden, Ala., Apr. 26, 1909.

Dr. B. J. Kendall Co.

Gentlemen: Please send me copy of your TREATISE. I have been using your Spavin Cure for 20 years, and find **it is the only sure remedy. It is the best liniment I can get for horse and man.** Yours truly, W. J. McBee.

That tells the whole story, and it is the experience that hundreds of thousands have had in the past 40 years, and it's the experience you will have—"It is the only sure remedy"—

For Spavin, Ringbone, Curb, Splint, Swellings and All Lameness

Sold By Druggists—$1.00 a Bottle, 6 bottles for $5.00. Keep it on hand always. Be ready for the emergency. Kendall's stops the pain, starts the circulation, penetrates and removes the **cause** of the disorders. Ask for a free copy of "A Treatise on the Horse." If not at dealers write to—

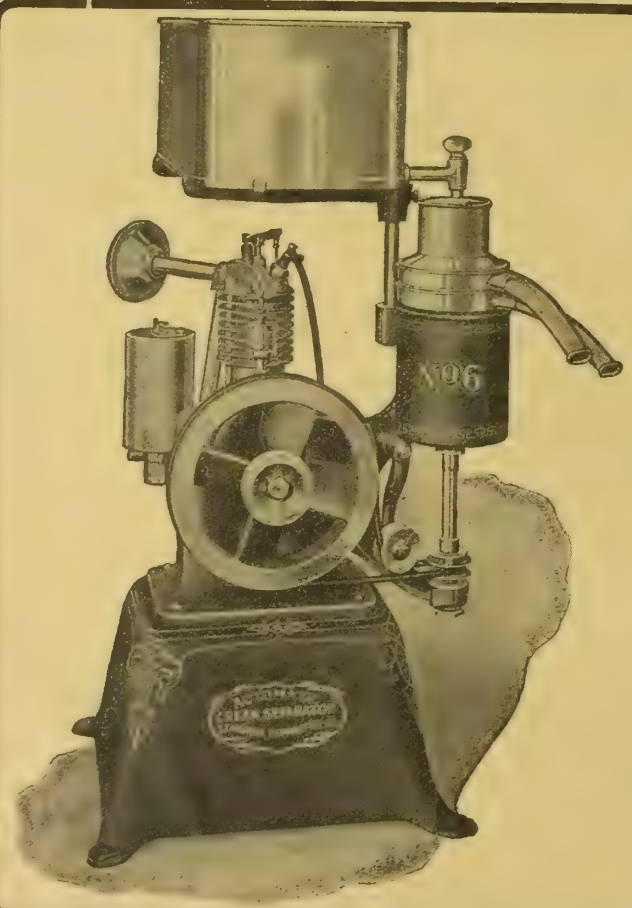
DRYER BUTTER.

The Commissioner of Internal Revenue, in a decision under date of March 3, 1911, transmitted to Collector of Internal Revenue Claude I. Parker, of the Sixth district of California, states that on and after May 1st, 1911, manufacturers of adulterated butter who produce a product which contains an excess of 16 per cent moisture, will have to pay a tax of ten cents a pound on all their product which contains such excessive moisture, and at the same time the special tax prescribed by law for manufacturers of adulterated butter, which amounts to $600 per annum.

Heretofore appeals and arguments in behalf of producers of such butter, have been considered, and in certain cases a portion of the taxes due has been omitted, but the government now takes the stand that there is a sufficient margin between the normal moisture content in butter and the 16 per cent limit, fixed by law and regulations, and that this margin is amply sufficient to protect all butter manufacturers against variations above the normal content.

The collector's instructions add that in the future this office will not entertain or consider the plea as the basis in relief for violations of this nature, that the incorporation of 16 per cent or more of moisture was due to accident, or that all precautions had been taken to guard against said condition, and in every case where it is shown that the product contains excessive moisture, all taxes due on account thereof will be assessed and collected; also forfeiture proceedings and criminal prosecution will be instituted in those cases where the facts demand such action.



THE AUTOMATIC SEPARATOR

THE 1911 SENSATION

At a glance you will appreciate the advantage of the "Automatic."

No more back breaking crank turning.

Simply start the engine, when you commence to milk and when through milking, turn off the switch and the work is done.

IMPORTANCE OF CLEAN MILKING.

A great many examples could be given of the influence of clean milking on the quantity and quality of both milk and butter. In Germany the experiment has been tried of allowing one person to milk five cows during fourteen days, and then another person milk the same cows during the following fourteen days. The cows were fed and served in exactly the same way during the whole of the time. The result, however, was that the second person on an average got about 4 lb. 6½ oz. more milk per animal per day than the first one.

A similar experiment was made by Prof. Babcock. Three cows were milked by one person, A, during a week, the following week by another person, B. From the milk A received during the week 31 lb. of butter were churned, while from the milk B got only 18½ lb. were produced. This result is not only owing to the greater quantity of milk received, but more still to the fact that the last drawn milk is by far the richest. That this is the case anybody may easily ascertain for himself by pouring the very first and the very last drops of milk from the same teat into cream tubes. When comparing the tubes after the cream has risen, he will be surprised at the great difference in the thickness of the layers of cream; the milk first drawn looks, judging from the layer of cream, like good skimmed-milk; the last milk drawn is more like

THE PERCHERON SOCIETY OF AMERICA.
Has just taken over all records and business of Percheron Registry Company of Columbus, Ohio. 215 breeders took membership in P. S. of A. during December and January alone. 137 more new members added thru recent acquirement named above. There is now but one recognized Society in the United States recording Percherons. For information address WAYNE DINSMORE, Secretary, Union Stock Yards, Chicago, Ill.

thin cream. It has been found that the first streams of milk contain only 0.6 per cent of fat, while the last strippings of milk from the same cow contained as much as 10.2 per cent fat. A thoroughly clean milking, therefore, is very important, not only as a means of developing the cow's milking power, but also to produce richer milk.

It is important, also, how often the cow is milked daily. Some experiments concerning this question have also been tried, which show that the more times a day the cow is milked the richer the milk she yields. But whether one milks three times or only twice a day, the intervals between the milkings must, as far as possible, be of the same length. The cow is in a very high degree dependent on habit, and her udder works evenly and regularly. The milking hours, therefore, must be carefully observed, and the same person should, every time in the same course, milk the same animal. If the milking is begun too late, the cow becomes uneasy, and the tension of the udder causes pain to the animal. In both cases loss of milk ensues. The fact that the quantity of milk is lessened by milking less frequently and less energetically is a thing of which one avails oneself when wanting to dry a cow. But even in this case it is a bad plan not to cleanly strip the udder; it is far preferable to milk less often, finally once only every other day, every third day, or more seldom still, till the cow gives so little milk that milking may be dispensed with.

The milker should pay great attention to the cleanly condition of the udder and the teats. If he observes knots and tenderness in the udder, sores on the teats, the milk canal stopped up, or the milk having an unnatural appearance, etc., some remedial steps should at once be taken. Diseases in udders and teats often being contagious, cows in that way affected must always be milked last, and the milk from the affected part of the udder be drawn into a special vessel and destroyed in order to stop further spreading of the infection.—Country Gentleman.

GUERNSEYS IN THE UNITED STATES AND CANADA.

Secretary Caldwell has been taking a census of pure bred Guernseys in the United States and the following interesting figures are the result:

Maine has 27 males and 97 females; Vermont, 53 bulls and 263 females; New Hampshire, 39—158; Massachusetts, 128—768; Rhode Island, 16—53; Connecticut, 62—348; New York, 290—1134; New Jersey, 67—382; Pennsylvania, 259—1400; Delaware, 6—25; Maryland, 30—102; District of Columbia 10—101; Virginia, 13—70; Tennessee, 2—4; Alabama, 1—4; Georgia, 42—218; Missouri, 21—88; South Carolina, 9—16; South Dakota, 2—7; West Virginia, 21—118; Ohio, 113—446; Michigan, 83—303; Illinois, 66—276; Indiana, 13—34; Wisconsin, 404—1659; Utah, 2—1; Minnesota, 109—536; Iowa, 55—146; Nebraska 2—10; Kansas, 16—33; Colorado, 5—11; Idaho, 2—33; California, 23—84; Oregon, 12—35; Washington, 1—4; Canada, 8—47; Texas, Kentucky and Arizona are reported as having no registered Guernseys.

The total number of registered males in North America by this census is 2012; females 11,226. There have been about 40 thousand registrations in this country since the breed was introduced but the above figures show clearly that the man who has a well-bred herd of registered Guernseys need not be afraid of very much competition for years to come. The demand for these cattle is vastly beyond the supply.—Hoard's.

Do your cows milk hard? Send 50 cents for teat expander. O. J. Weber Co., 225-227-229-231 East Sixth St., Los Angeles.

COOK PORK WELL.

Cases of illness sometimes occur from eating uncooked or insufficiently cooked pork which is infested with a microscopic parasite commonly known as trichina or flesh worm, the scientific name being Trichinella spiralis. An average of one or two per cent of the hogs slaughtered in the United States are infested with this parasite. When transmitted to human beings, trichinae may cause serious illness, sometimes resulting in death. Out of about 15,000 cases of trichinosis recorded in medical literature, most of which occurred in Europe, 830 resulted fatally.

No method of inspection has yet been devised by which the presence or absence of trichinae in pork can be determined with certainty, and the government meat inspection does not include inspection for this parasite. All persons are accordingly warned by the United States department of agriculture not to eat pork, or sausage containing pork, whether or not it has been inspected by federal, state or municipal authorities, until after it has been properly cooked.

A temperature of about 160 degrees Fahrenheit kills the parasite, therefore pork when properly cooked may be eaten without any danger of infection. Fresh pork should be cooked until it becomes white and is no longer red in color in all portions of the piece, at the center as well as near the surface. Dry salt pork, pickled pork, and smoked pork previously salted or pickled, providing the curing is thorough, are practically safe so far as trichinosis is concerned, but as the thoroughness of the curing is not always certain, such meat should also be cooked before it is eaten.

A creamery is planned for Reedley, Fresno county, and it is hoped to have it in operation by the middle of July.

PRODUCE MARKET.—Los Angeles Market; San Francisco Market; Citrus Market; 414, 415.

The Illinois Cattle Feeders Association holds a meeting this week at the agricultural college of the state at Urbana to discuss matters of interest to cattle feeders.

New York City is falling into line with its first land show. This is the only one so far announced on the Atlantic seaboard. While arrangements are already being made for it, the show is not to occur until November 3-12.

A plot has been discovered by Governor Hoke Smith to distribute the boll weevil throughout the cotton-raising districts of Georgia and South Carolina by enemies of that section. It is unthinkable that any human being would desire to so injure his neighbors.

Preparations are being made for a more successful summer school at Berkeley than heretofore, in view of the coming of the National Educational Association to San Francisco. Studies are to be so arranged that students may attend the meetings of the Educational Association as much as possible.

We note in a trades union paper: "The time for regret is always at hand; the time for action is now. Co-operate." Plenty of fruit growers in this state have observed the time for regret; some have also learned the advantages of co-operation and have acted. Large manufacturing interests are wise and co-operate. Let the fruit growers be equally so.

It is to be hoped that the discovery by County Horticultural Commissioner Morris of Santa Clara county of a wash which it is claimed will control the dreaded pear thrips will prove effective. It is a lime-carbolic spray, exceedingly simple and economical, and is reported highly successful, killing all the thrips in orchards where applied, without injury to the buds.

It is remarkable the amount of interest shown in the avocado or alligator pear. No extensive plantings are being made, but a few trees are being set out to determine the adaptability of different varieties to various sections of the state. For the first time, trees are being planted in the San Joaquin Valley. We believe they should not be extensively grown until tested out, but sure it is the fruit has proven wonderfully profitable wherever it grows well.

The fruit growers of Walla Walla Valley, in Washington, have been investigating the subject of packing low-grade fruit in barrels, similar to the Eastern method. Investigation was made in the hope that it might prove more economical than packing in boxes, but, considering the additional labor and all, it was found that the barrels would cost about 38 cents and the packing 10 cents, leaving a margin so slight that the box pack has been declared the only way to ship coast apples.

The United States exported for the eight months ending February, 1911, $501,800,000 worth of manufactured cotton; for the same period ending February, 1910, $348,600,000, a material and satisfactory increase. With corn the increase was not so marked —$22,800,000 as against $16,600,000 in the preceding year. Standard Oil seemed to be hit for we notice a decrease from $42,000,000 to $35,000,000. We also have to own up to a decrease in exports of cattle, which amounted to $10,000,000 in 1910 and only $7,000,000 for the eight months just ended.

WARNING NECESSARY.

After Mr. Powell's investigations as to causes of citrus decay and the effort to secure greater care in handling and the benefit from it, it seems that it should be sufficient. However, the heavy decay this year induced Mr. Powell, now with the Citrus League, to ask another investigation, and Mr. C. W. Mann, of the division of field investigation in pomology, has been in the state since February 1. He has just issued his first statement, as follows:

"The increase in decay in orange shipments during the present season has led to a renewed investigation of the conditions under which the fruit is being handled. In the work of the department on oranges several years ago it was shown that by avoiding the mechanical injuries of the fruit in handling, the common form of decay, blue mold, can be largely prevented, and that the degree of care exercised in handling the fruit was the principal factor in lessening decay. Many of the growers believe that the fruit is physically weak this year, and that it is naturally more susceptible to decay when infected with blue mold through bruises or breaks in the skin.

"This year's inspections of fruit show an unusually large amount of injury in handling. Inspections in twenty-five or more packing houses have shown in many instances more than 20 per cent of the fruit injured in picking, and in a few cases as high as 50 to 85 per cent. The damage from clippers is generally less common than formerly, but other kinds of injuries are greater, such as punctures of the skin caused by loose stems and gravel in the picking boxes, the bruising of the fruit and scratches caused by dead wood or branches when the fruit is picked.

"Packing house tests are being carried on with carefully handled and commercially handled fruit to determine the extent of the decay developing in each under like conditions. The fruit is packed and stored in the packing houses for a period of twelve to fourteen days, the length of time required to reach the Eastern markets, after which it is inspected. The results in these experimental lots of fruit have clearly shown the effect of mechanical injuries in increasing the decay. In the fruit which was packed under the supervision of the department and has been inspected up to the present time there has been an average decay in the ordinary commercial pack of 12 per cent, while similar fruit picked by the same crews after instructions were given in more careful methods of picking has shown an average decay of 6.5 per cent. In other words, the decay has been found to show a decrease of 50 per cent due to more careful methods of picking, and a still further reduction would undoubtedly be shown by the application of greater care in the operations in the packing houses.

"In the former investigations of the department it was demonstrated that the fruit which is free from injuries or punctures of the skin rarely develops decay, and reaches the market in sound condition; that by close supervision of the picking and the careful handling of the fruit in the packing house decay can be very largely eliminated. The results obtained in the work thus far this year fully bear out the previous investigation in showing the importance of the question of careful handling in its relation to decay."

TEST YOUR TREES.

On our leader page this week is given the address of Mr. A. D. Shamel of the Bureau of Plant Industry before the Citrus Growers Convention at San Bernardino. Mr. Shamel is now located in Riverside, where we trust he will be for years to come, in his work of investigation. He has had long training in plant selection, largely with tobacco and corn, but he has already made some interesting citrus investigations.

For the benefit of those who may wish to do a little investigating of their own, we give on cover page a facsimile of record sheet of each year's performance of every tree on which the test is being made. It has taken years for dairymen to learn the profitableness of testing each animal in their dairies. Such tests show the cows that are not only worthless but a drag on the rest of the herd. Mr. Shamel's work is showing that testing the orange trees will do the same thing for the orchardists. The careful grading of fruit as practiced by Mr. Shamel may be impracticable for the general orchardist, but a general idea of the tree's performance may be had which will determine whether it is worthy of being retained, rebudded or rooted out.

DAIRY STATISTICS.

The eighth biennial report of the state dairy bureau covering the years 1909 and 1910 has just been issued, and it is a report of dairying and creamery conditions during those two years. The duties of this bureau are the prevention of unlawful sale of substitutes for dairy products, of manufacture of cheese unless labeled full cream, half skim or skim, of sale of renovated butter, of the use of inaccurate testing apparatus, or chemical preservatives, of misbranding of butter, and the dissemination of general information relative to the dairy industry. A list of prosecutions undertaken by the bureau is also published in the report, a list unfortunately greater than it should be. In this connection it seems to us that an injustice has been done in publishing the names of dairymen arrested, but whose cases were dismissed on motion of the prosecuting attorney, and who presumably were arrested without just cause.

The value of dairy products in this state during 1909 was: for butter $13,186,044, for cheese $632,331, for market milk and cream $9,023,000. In 1910 the butter produced amounted to $14,403,798, cheese $724,212, market milk $9,050,000.

The chairman of the bureau is M. T. Freitas, and F. W. Andreason of Berkeley is the secretary.

DEMONSTRATION TRAIN.

The fifth demonstration train service for the year opens in Compton and Downey today. Tomorrow it is at Whittier, Norwalk and Buena Park; Saturday, at Anaheim, Santa Ana and Smeltzer; Sunday, Los Angeles. On Monday morning, April 3, the train starts at 8:55 from Los Angeles, opening that day at Lankershim, Chatsworth, Simi, Moorpark and Somis; Tuesday, Camarillo, Oxnard, Montalvo, Saticoy and Santa Paula; Wednesday, Piru, Fillmore and Ventura; Thursday, Nordhoff, Carpinteria and Santa Barbara; Friday, Goleta and Lompoc; Saturday, Guadalupe, Oceano and San Luis Obispo; Monday, April 10, Templeton, Paso Robles, San Miguel and King City; Tuesday, Metz, Soledad, Gonzales, Salinas; Wednesday, Castroville, Santa Cruz, Aptos and Watsonville.

Agricultural News Notes of the Pacific Coast

Northern California

Hay is now commanding $20 a ton in Lassen county.

The Ukiah farmers club now has a membership of forty.

Butte county will plant about 75,000 orange trees this season.

Princeton, Colusa county, will hold a rose carnival April 29th.

Chico expects the early establishment of a $7000 alfalfa meal mill.

An up-to-date cheese factory is to be started near Biggs, Butte county.

Several large tracts near Yuba City, Sutter county, are being subdivided into small holdings.

More than 14,000 acres of reclaimed land in Yuba county, south of Marysville is being colonized.

Ranchers and sportsmen of Yuba City engaged in a rabbit drive and claim a bag of 1000 bunnies.

It is claimed that Shima, the Jap potato king, has cleaned up over $150,000 during the season.

Sacramento county's creameries paid over three-quarters of a million dollars to the farmers during 1910.

The Armsby Preserving Company's plant near Yuba City is labeling and shipping out its last season's pack.

The Sacramento Valley Irrigation Company has acquired a large interest in the Hamilton Beet Sugar Company.

Work has been started on the reclamation of several thousand acres of tule land between Suisun and Benicia.

Almond orchards near Chico report damage from rains at time trees were in full bloom. The crop will be very light.

Over 260,000 pounds of butter recently arrived in San Francisco from New Zealand for reshipment to British Columbia.

One of the greatest irrigation enterprises will be the Truckee-Carson Project which will cost aproximately $3,500,000.

Sacramento capitalists have purchased 6000 acres near Corning, Tehama county, and will subdivide into small tracts.

The state veterinarian reports stockmen better organized and less disease infesting live stock of the state than for many years.

Members of the Farmers Union at Gridley, Butte county, are planting melons, having been guaranteed a dollar or better per crate.

Debris from the mines of Amador county is causing trouble to agricultural lands below and the Anti-Debris Association has been appealed to for relief.

County Horticultural Commissioner Galloway of Sonoma county reports that the heavy rains have delayed winter spraying of apple orchards until rush work will be necessary.

Ukiah Farmers Club has been organized with the following officers: President, J. C. Johnson; vice president, Mack Howard; secretary, C. A. Bernhard; treasurer, Frank Albertson.

The Chamber of Commerce of Santa Rosa, Sonoma county, estimates that much of the prosperity of that section is due to the fact that the farmers go to market with two baskets, eggs in one and fruit in the other.

Central California

Packers are now freely offering 3½ cents for 1910 Muscat raisins.

The Raisin Day campaign has been somewhat delayed because of lack of funds.

The supervisors of Madera county will appoint a squirrel inspector for that county.

Maple Grove Creamery at Hanford, Kings county, is making extensive improvements.

The board of directors of Tulare Irrigation District are busy issuing the new bonds, which are said to be beauties.

Steps were taken at a meeting at Exeter, Tulare county, for the organization of a citrus district board of trade.

The Spreckels Sugar Company is adding to its capacity by the installation of a $25,000 steam plow built in England.

The county clerk of Tulare county is posting notices calling for extermination of all ground squirrels within that county.

Over 200 acres of eucalyptus trees have been planted at Greenfield, Monterey county, but almost entirely in small tracts, widely scattered.

Horticulturist Volck of Santa Cruz county reports that while the Northern Spy root shows some infestation of wooly aphis, it is to be preferred.

Interest in the new million-dollar raisin co-operative movement is increasing, and incorporation will be completed when $750,000 in stock is subscribed.

Practically 22,000 acres of land in the Salinas Valley have been signed up to the Spreckels Sugar Company. The indications are for the biggest beet crop ever.

Pajaro Valley orchardists are demanding the deepening of the channel of Pajaro River, and to that end are asking for the formation of the Pajaro Protection District.

County Horticulturist Earl Morris of San Jose reports success with a new remedy for thrips. It is composed of 100 pounds of lime, 100 gallons of water and one gallon of crude carbolic acid.

April 1 was chosen as Blossom Festival Day at Saratoga, Santa Clara county, and if the weather is not too cool to prevent the opening of the bloom, the usual annual picnic will be held.

The Santa Cruz County Poultry, Dog and Pet Stock Association was founded last week with a membership of 151. The first show will be held in Santa Cruz July 20, 21 and 22. The secretary is Charles E. Pond.

The raisin day committee is providing for the approach to raisin day by naming March 23 as raisin pudding day, March 24 as raisin confection day, March 25 as raisin salad day, the 26th as sandwich day, and the 28th as raisin cooky day.

The Santa Clara Valley Poultry Association is issuing a call to other associations to send a representative to a meeting to be held in San Jose next Tuesday, April 4, the purpose being the formation of a state association composed of representatives of county associations over the state.

Southern California

Orange county has the biggest peanut output of the state.

Orange county claims 509 pumping plants located on its farms.

Work is being pushed on the levees of the Colorado in the endeavor to hold the flood waters.

Another experimental date farm will be established at El Centro, Imperial county. Ten acres have been leased for 20 years.

An attempt was made last week to destroy the packing house of the Mountain View Orange and Lemon Association at Upland.

In the Santa Maria district, Santa Barbara county, over 1,000 acres of fertile soil was washed into the ocean by the Santa Maria river.

Farmers institutes have been arranged for April 10 at Hemet; April 11, Perris; April 12, Elsinore; April 31, Arlington; April 14, Corona.

Some Imperial Valley settlers who have not yet proved up on desert claims have been granted extension of time by the general land office.

Almond growers of Banning, San Bernardino county, have appointed a committee to investigate the advisability of forming a marketing association.

The state legislature has appropriated $15,000 for agricultural experiment station work in connection with Heber Collegiate Institute, Imperial Valley.

Tree Warden Reed of Riverside has been sued for $2,000 damages caused by a blast under a roadside stump which was being taken out by his direction.

E. J. Wirer, of National City, San Diego county, has a five-acre lemon orchard which he estimates will give him six cars of fruit for shipments this season.

A great many lemon groves near Chula Vista, San Diego county, are changing hands. These groves have done exceptionally well during the last few years.

Mr. Baxter, of Lemon Grove, San Diego county, picked 2,300 boxes from ten acres at one picking this month, while his neighbor, Major Bodges, gathered 814 from five acres.

Apricot growers predict the fruit will be much later this year. Drying began on June 20th last season. Present condition of blossoms indicate it will be much later this season.

The Imperial Valley's cotton production for last season was 5779 bales, of which El Centro produced 2093, Brawley 1077, Holtville 929, Calexico 852, Imperial 802 and Heber 26.

Los Angeles county supervisors have called a meeting at Los Angeles on April 5 of supervisors of counties in the southern part of the state to discuss the matter of the $18,000,000 state road bond expenditure.

The week ending March 18th was the week of California's biggest shipment of citrus fruits. The Salt Lake railroad was out of commission because of washouts so that all the shipment went over the Santa Fe and Southern Pacific. The latter took out 881 cars while the Santa Fe reported 1190, or a total of 2071 cars for the seven days.

The Coast

Seven indictments have been issued in the Alaskan coal land frauds.

Dayton, Washington, reports less grain stored than for ten years.

The Annual Fat Stock Show at Portland, Oregon, is on this week.

An apple orchard of 1000 acres will be planted at White Salmon, Washington.

The State Bee Keepers Association of Utah will convene at Salt Lake, April 8th.

Experts from the state college of Washington held a farmers institute at Hayford last week.

A large tract near Ellensburg, Washington, is to be subdivided into small ranches and supplied with water.

Irrigation canals of government projects in Eastern Washington are being kept free from weeds by pasturing sheep.

The Benton County Poultry Association recently incorporated with F. E. De Sellem of Kennewick, Washington, as president.

Portland dairymen are up in arms because of unjust discrimination in an ordinance recently passed by the city council.

Conservation of the waters of the Touchet river near Dayton, Washington, will provide for irrigation of much additional land.

Winter grain at Athena, Umatilla county, Oregon, is reported in the best condition, no winter killing having been observed.

Surveys are being made along Weston and Pine Creeks, near Western Oregon, for canals which will irrigate about 10,000 acres of land.

The poultry association of Polk county, Oregon, was compelled to buy more coops in order to care for all exhibits at the last show.

In accordance with recent enactment of the state legislature, Governor Norris of Montana has appointed a board of poultry industry.

The forester of the Blackfoot National Forest in Montana is planting large quantities of yellow pine seed and experimenting with other forest trees.

The recent act of congress authorizing the secretary of the interior to sell allotments in Indian reservations will throw open valuable lands in Eastern Washington.

The United States senate agreed to an amendment to the Indian bill which appropriates $50,000 for work on the irrigation project of the Klamath Indian reservation.

Work is being commenced on a canal to divert Lost River in Klamath county, Southern Oregon, so as to drain thousands of acres of low land and irrigate other dry lands.

With the large increase of lands brought under irrigation in the Yakima reservation it is feared there will be shortage of water this year. The snow in the mountains is said to be much less than last year.

At the time of the visit of Theodore Roosevelt next week to Moscow, Idaho, a demonstration will be made of the chief product of that section by building the platform on which the ex-president will make an address of hundreds of tons of wheat.

FRANK J. IRONMONGER

Practical Poultry Culture

TRAINING A CHICKEN DOG.

J. K. Tuley, Fresno.

If you want a good chicken dog get a puppy that is a cross between an Irish setter and a Spitz. I have two young fellows whose mother was a Spitz and the father an Irish setter. As soon as they were weaned I put them in a run with two dozen hens and they at once considered themselves members of the family. They seemed to think that they were a sort of chicken themselves and tried to do everything they saw the hens do except fly up to roost. They sample every kind of food given to the chickens—pounded bones, bran, charcoal, ground shells and chopped green food. They imitate the chickens in scratching after the grain buried for them, though they seem puzzled to find out what the hens get from that business. The hens look upon them as being a settled part of the arrangement, creep between their legs and walk over them, and in rainy weather they all huddle together to keep warm. They are very watchful and no prowler could get inside the yards without an alarm being raised.

Their father is a good bird dog and the mother a good Spitz, but they are neither the perfect poultry dogs that the puppies are. The father looks upon the chickens as game and wants to see them bagged. He is pretty headstrong and to be ruled with a strong hand. And the mother: Well, she is a Spitz, and when that is said it is all said. If a Spitz is ever anything but a Spitz I have never been able to discover it. She is as intelligent as the Irish fellow, but it is all Spitz intelligence. She will obey when she is told to stop or come back, but she is constitutionally opposed to doing anything useful. But the puppies have the intelligence of both breeds. They want to obey, which is a trait of the mother, and they can be taught to do all the tricks that the father does—which is something that you can't teach the mother.

It is a characteristic of straight-line breeding to settle to a type. Even the thoroughbred horse when bred in a straight line after a while becomes so attenuated to a type, so aristocratic, that he must be crossed with something more virile, something closer to nature, to restore his usefulness. The Chinese as a race do not advance. They have become a fixed type. If you want a sport, which is another term for genius, you must cross species. Burbank develops his wonders in the vegetable kingdom through cross-fertilization. That is what is making the American people the leading race of the world—the crossing of types. The trick dogs of the showman are not straight bred. A mongrel isn't a mongrel because he is of mixed breeds, but because of his lack of "bringing up."

A Scotch collie is a fine animal, intelligent, tractable, lovable and useful, but for the life of me I can't have the affection for a straight bred collie that I have for his illegitimate son.

RAISE BETTER QUALITY.

Why not better the quality of the flock this season by more careful selection. Don't use eggs from the entire flock for hatching, but make up a breeding pen of your best hens and use only their eggs. Twenty hens in a colony house about 7x9 out in the orchard, will furnish a setting of eggs per day during the season, which is about all the average farmer will care to use. Keep two males for this pen, changing every few days. The right kind of a cock bird is too unselfish for his own good and will call the hens to eat all the good things while he goes hungry; shutting him up a few days and feeding him will keep him in better condition.

This plan also prevents fighting and will mean more fertile eggs. Weight, vigor, appearance of the flock, laying qualities, all will be greatly improved and the infertile eggs produced by the balance of the flock will keep better during warm weather, and will be much better for putting away for next winter.—W. E. Vaplon, Colorado Agricultural College.

HERE'S TO THE HEN.

"Music hath charms;" and especially when
It comes from the throat of some long idle hen.
For it builds in the breast of the man who eats eggs,
A thought that high hen-fruit will drop a few pegs.
Nor do we much care if she's not tuned to A.
Our concern is to whether her cackle means, lay!
Her breed cuts no ice, be she dunghill, or game,
Her fruit's what we're after regardless of name.
For the high cost of living hath stolen life's charm.
And we greet the glad cackle that flows from the farm;
For as soon as the hen fruit comes rolling to town
The merchants to farmers will say, "eggs are down."
So here's to the hen. "May her son never set."
And the more that she cackles the cheaper eggs get.
Cheer up, married brother! Let us look to the hen
To mellow the burdens that fall upon men.—Ex.

As to individual taste, the old Indian said if men were all alike they would all want his squaw. If we all had the same taste nothing but White Leghorns or Black Orpingtons or Buff Cochins or some one kind of bird would satisfy us. But, fortunately, the human family is made up of individuals and, thanks to accident and science and honest endeavor and all of those things that usually go to make up success, so many varieties of chickens have been evolved that it seems as if there could be nothing left to be sought after or desired in the way of beauty or utility.—Nebraska Farmer.

A man who has had a good deal of experience raising turkeys, says he has just one remedy for scours in young turkeys and that is grated onions. At the first signs of bowel trouble in the poults, he begins feeding them onions and after that he has no more trouble.

Do not forget that fowls need a dust bath occasionally. If the ground is hard in the runs, dig up fresh earth and place coal ashes within their reach. The dust bath helps fowls get rid of lice.

Go In and Make Money

Poultry offers the surest, easiest way of anything that's open to you. Don't waste *all* your time considering. Go in and *make* it win.

I have started over 61,000 people the Queen Incubator Way. May I do the same for you? Get my offer on

The 1911

Queen

Incubator

The incubator that makes money for poultry raisers. Take one and *try it* for 60, 90 or more days and prove for yourself that it is the hatcher I claim it to be. I take all the chances. *I pay the freight*, too, and give a 10 year guarantee now. It is my way of showing people what they can accomplish with Queens.

Get the 1911 Queen Book

The New Queen Poultry Guide and Catalog is larger and finer this year than ever. It tells how to make money with poultry and how to get a Queen Incubator on the most generous terms ever offered. NEW TRACTION ENGINE For Sale or Trade

We have a brand new 40 H.P. Traction Engine (Hart-Parr make), which we will sell or trade for land, horses or what have you? We ordered this engine to put in some land and sold the land before the engine arrived. It has never been used. Cost $3,000. Address EDW. GREENFIELD, 100 Chamber of Commerce Bldg., Los Angeles.

TO DESTROY FOWL TICKS.

The following is taken from a report by a committee of the Agricultural Society of Trinidad and Tobago, which was appointed to inquire into the question of fowl ticks. The report appears in the Journal of the Society, December 1910, p. 496.

To rid a badly infested fowl house of these pests is a difficult undertaking, and if the building is old or badly constructed, so that it affords an abundance of hiding places for ticks, it is often cheaper to replace it by a new and suitable structure. Never use the old material for the new building, nor erect a new fowl house on the site of the old, or near it. If the lumber from the old house is good enough for some other purpose, store it out of reach of the fowls.

A jet of flame from a blast lamp is probably the most effective means which can be used to destroy ticks in an infested fowl house. Pass the flame slowly and carefully over every crack and crevice, and force it in as far as possible. After this has been

Barred Rock Cockerel.

thoroughly done, paint the whole inside of the fowl house with tar and lard oil (2 oz. of oil to 1 gallon of tar). Aim at sealing all cracks with this preparation. It will adhere well, and will remain sticky for a considerable length of time. Some prefer to heat it before applying. The floor should be cleaned, and lime freely used on it. If necessary, reconstruct the roosts on lines above indicated. Destroy the old nesting boxes, and care for the new in the proper manner. Adult ticks will be found on the fowls only by night. Only a small portion of the pests would be found each night by searching on the bodies of the birds, and this procedure would disturb the flock too much. The larvae remain on the hosts for several days, and can be found in the daytime. Here hand dressing, if a somewhat slow process, is effective when properly done. Oils thoroughly rubbed in are the best remedies. They will clog the breathing pores of the creatures, and so destroy them.

Kerosene oil and sweet oil give most satisfactory results. Kerosene oil and cocoanut oil in equal proportions have proved very efficacious. A mixture consisting of sweet oil (2 parts), 10 per cent solution of caustic potash (4 parts) and kerosene (6 parts) is highly recommended from Australia as a dip. Careful dusting with Keating's powder by means of a blower—pushed along under the feathers so that the powder will reach the skin—will also answer well for this purpose. Among the numerous insect powders on the market, this brand has proved the most reliable. The fresher it is, the better.

All these preparations deteriorate rather quickly in our climate. Fowls which are infested should never be placed in a new fowl house. They should be kept separate, and treated until entirely free from parasites. If some members of a clean stock become infested, they should at once be segregated and given attention; the fowl house in which they have roosted should be inspected and tarred.

Fowl ticks can be exterminated, but painstaking care must be exercised in order to accomplish their destruction. Unremitting vigilance is the poultry raiser's greatest safeguard against these pests.

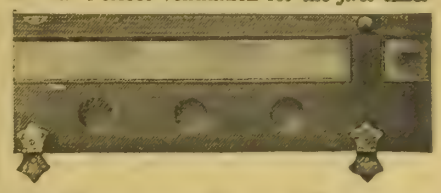
DETERIORATION OF POULTRY AND EGGS.

The study of the deterioration of poultry and eggs, which at first was concerned chiefly with changes occurring during storage, has broadened out so as to include every step in the handling of these products. It was soon found that in no other way could the problems involved be attacked, inasmuch as the chemical and bacteriological data obtained could only be intelligently interpreted by a knowledge of the history of the product before entering storage, including methods of killing, dressing, shipping and marketing. To this end the cooperation of associations of poultry dressers, merchants, railways refrigeration, transportation companies, and warehousemen has been obtained and the most interesting and instructive data have been assembled. The interrelations established explain many variations in data, and in turn the scientific observations set their stamp plainly upon the various methods as producing satisfactory or unsatisfactory products. Extensive shipping experiments were made from Chicago as a center. After visiting the large poultry packing houses throughout the Middle West, observing their methods, and making an accurate record of every detail of manipulation, shipments were sent to Chicago, the carload was met on its arrival, samples were taken for laboratory work, the condition of the car and its contents were examined, including the temperature records, and some of the packages were followed further through the warehouses, and the market handling, including in several cases a second shipment by rail.

Specific practical points observed to have a direct bearing on the quality and keeping properties of the product have been studied in the field laboratories located at packing houses—for example, the best way of killing and bleeding fowls and the proper implement to use for the purpose, on which circulars have been issued. The variations in drawn and undrawn poultry were experimentally studied on a commercial scale, as were also the comparative merits of scalded and dry picked fowls. In every case the chemical and bacteriological changes determined are correlated with the history of the shipment and of the conditions of the experiment, and in this way the many factors entering into the problem are controlled. Shipments were made in hot and cold weather and, as far as possible, all the variations occurring in actual practice were duplicated and their effect on the problem weighed. An investigation of the egg industry along exactly the same lines has been inaugurated, data having already been obtained on the changes taking place in eggs of known history and of low commercial grade, during periods of storage and at different temperatures, which will serve as the scientific basis for the study of commercial conditions.—U. S. Ex. Sta. Record.

More Inventions by Lee

Here's his new Incubator door all are talking about. Perfect ventilation for the *first* time.

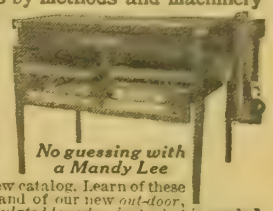


Mandy Lee Incubators

supply life-giving oxygen freely to the eggs and just as naturally draw off the poisonous gases. The most important step ever taken in incubator ventilation—neither above nor below, but *right at the eggs*—the correct principle, for the new Mandy Lee is making better hatches of *stronger* chicks than any other incubator in the world.

We Measure Everything

Heat—moisture—ventilation. You *guess* at nothing. If the eggs are good and you follow simple directions your work with a Mandy Lee is as nearly an absolute certainty as anything can be. There is no more reason why you should buy an incubator that regulates nothing but heat than for a farmer to continue to harvest his crops by methods and machinery used 100 years ago. Your success with poultry depends on your ability to select equipment that is *right*—that's what you *always* get from us.



No guessing with a Mandy Lee

Send *to-day* for new catalog. Learn of these new improvements and of our new *out-door, lamp-heated* and *regulated brooder*, just what is needed.

A LABORATORY IN THE DESERT.

The latest method of solving the problems of the desert finds expression in a single unique institution—the Desert Laboratory of the Carnegie Institution of Washington. About eight years ago the institution determined to establish a department of botanical research, the chief function of which should be the study of the relation of plants to physical environment. It was decided that the most profitable results could be obtained in a dry climate where conditions are rigorous and botanists have as yet done comparatively little work. Accordingly a laboratory was established near Tucson, the largest city of Arizona, and is now actively at work with a considerable staff of botanists under the direction of Dr. D. T. MacDougal. The purpose is to study the abstract problems which are essential as the foundation of real progress. They bear the same relation to agriculture that a knowledge of human antomy and pathology bears to the practice of surgery and medicine. The problems are not selected with a view to immediate "practical" results, although their solution may ultimately be of incalculable importance in the affairs of every-day life. They may require tens or scores of years for solution. No government institution could possibly undertake them, for legislatures are not yet educated to the point where they can see that abstract science pays.

The tale of man's conquest of nature is an old, familiar story. In the portion dealing with the desert a new chapter is now being written. For ages the world has seen men like the rancher from Kansas who passed us in the twilight with his tale of failing crops and starving cattle. Their pluck and endurance have won great victories, but in the end the rigors of the desert have defeated them, except where streams from the mountains furnish verdure and life. Their cry has gone up for succor, and the country has answered with great irrigating dams and ditches on the one hand, and with experiment stations on the other. But those who build the dams are the first to tell us that the total supply of water, both above ground and below, is so small that scarcely a tenth of the land can ever be adequately watered; and those who experiment with crops know that their knowledge of how plants grow is so slight that half their work is in the dark. And so there is another cry, much fainter than the first because only the far-seeing realize how great is the need. That cry demands pure knowledge apart from any practical result. To obtain that knowledge is the work of the laboratory. Part of what is learned may help the world materially tomorrow, and part may remain unused for a hundred years, or may never be used except as a step toward some other phase of truth. Yet even so its value is incalculable. The very fact of the existence of the desert laboratory will stir ten men to think where one man thought before. —Ellsworth Huntington, in Harper's Magazine.

A whisk broom is ideal for sprinkling clothes. If dipped lightly in the bowl you will find it evenly distributes the water.—Interested Reader, in Wallace's Farmer.

ENCOURAGE TREE GROWING.

Tree growing is a fascinating work for children and may be profitable to them as well if they will grow good ones which is possible for them if they will but give the work careful attention. The work certainly adds to their knowledge of the everyday things about them. This is realized by the University of California which issues circular No. 59, "Tree Growing in Public Schools." It is written by Ernest B. Babcock and Harry A. Greene. In the foreword they say:

"Tree-study and tree-growing comprise a special phase of nature-study and gardening. Gardening is one kind of manual work that is possible in some degree for every school. Moreover it is found to offer the most interest, opportunity and educational value of all manual work when properly conducted, while it can be correlated with most of the other studies to great advantage. Children have studied about trees in school for years. As a part of nature-study the work with trees has been largely confined to practice in identification and to observation of life histories, together with stories about trees in lower grades, and, rarely, elementary forestry from books and bulletins in upper grades. This is good as far as it goes, but it lacks the one thing essential to vital teaching. Boys and girls should learn to grow trees. Then they will have a sound basis for intelligent appreciation of the economic importance of trees. We have made pupils learn dry facts about lumbering long enough. Now let us have them first understand what it means to grow trees for lumber and we shall see the next generation more intelligent on the great subject of conservation."

Lists of best trees to grow and other information is given. It should inspire extension vacational studies in all schools.

PRESERVING THE NATURAL COLORS OF FLOWERS.

Take very fine sand, wash it perfectly clean, and when dry sift it through a fine sieve into a pan. When the sand is deep enough to hold the flowers in an upright position take some more sifted sand and carefully cover them. A spoon is a good thing to take for this, as it fills in every chink and cranny without breaking or bending the leaves. When the pan is filled solidly, leave the flowers to dry for several days. It is a good plan to warm the sand in the oven before using it, as the flowers will then dry more thoroughly. In taking the sand off great care must be taken not to break the leaves, as they are now dry and brittle. Pansies preserved in this way will keep their shape and brilliancy of color and many other flowers can be equally successfully treated—anything, in fact, where the full pressure of the sand comes on both sides of the leaf; otherwise they will shrivel. To fill in flowers with cuplike shapes it is better to lay them on the sand and with a small spoon fill in and around each flower. Ferns when preserved in this way have a more natural look than when pressed, and the maidenhair fern looks almost as well as when it is freshly gathered.

100,000 fruit trees will be set in Sacramento county this year.

—best by every test

The Popularity of **Pioneer Roofing** is due to its **wearing** qualities. We want to go on record right here and now with the positive assertion that a "Pioneer Roof" will outlast **two** ordinary roofs. The first cost is little if any more than you would have to pay for roofing of inferior quality. And once a "Pioneer Roof" is on, there is no further cost. It requires no paint or repairs.

Pioneer Roofing is made in several weights; suitable for residences, hotels, outhouses, business blocks; anywhere that a sunproof, rainproof roof is required. Comes in handy rolls. Easy to lay. No special tools needed. Everything necessary will be found in the center of each roll, for which there is no extra charge.

Free Booklet and Samples

The mauufacturers of Pioneer Roofing have published a 32-page booklet, which is effectively illustrated. The booklet is both interesting and instructive. It tells how to lay roofing—and what weight or thickness of roofing is best suited to the various kinds of buildings. The booklet and samples of roofing will be mailed free upon request.

Garden and Field Crops

SYMPTOMS OF DISEASE IN PLANTS.

It is highly important that farmers and horticulturists should be able to recognize plant diseases. Many fail to do this because they do not know the general symptoms that indicate the attacks of insect or fungous enemies.

Plant diseases may be divided into three groups: (1) Nutrition disturbances due to unfavorable conditions in the environment of the plant or inherent in the plant itself; (2) troubles due to parasitic plants, usually either bacteria or fungi, but sometimes to flowering plants, which deform, stunt, or kill the plant; and (3) insect pests, which are in many cases very evident but often not easily detected.

The first step of importance to the farmer is to be able to determine the presence of disease and to endeavor to find out its cause, nature, and probable outcome, and the treatment which should be employed. The principal symptoms of disease in plants are the following: (1) Discoloration, or change of color from (a) normal green to a yellow or white pallor; (b) colored spots or areas, as white or gray on leaves or stems, such as mildews or white rusts, many leaf spots of yellow, red, orange, brown, black, or variegated colors, red or orange rusts, black rusts, tar spots, and the like; (2) shot-hole perforation of leaves; (3) wilting, such as damping off or wilt; (4) necrosis, such as death of parts of plants, leaves, twigs, stems, or flowers; (5) reduction in size, such as dwarfing or atrophy; (6) increase in size, such as hypertrophy; (7) replacement of organs by new structures; (8) mummification; (9) change of position; (10) destruction of organs; (11) excrescences and malformations, such as pustules, tumors, corky outgrowths or crown galls, cankers from malformations in the bark generally resulting in an open wound, punks, or conches and other fruits of fleshy fungi, witches' brooms, rosettes, and hairy root; (12) exudations, such as slime flux, gummosis (especially for stone fruits), and resinosis (especially for coniferous trees); and (13 rotting, such as dry and soft rots, root rots of alfalfa, cotton, beets, or cherries (generally of fleshy or woody roots), stem or trunk rot, such as dry rot of trees and of modified stems like rhizomes, bulbs, or tubers, and bud and fruit rot of various fleshy fruits.

Soils decidedly alkaline, lacking in proper drainage, or deficient in iron may produce a yellowing of the foliage, while discoloration of restricted areas on the leaves is usually due to the attacks of some insect or plant parasite, presumably the latter.

In general, any marked variation in color or shape from the normal type is a sure indication of disease which in many cases may be controlled and the crop saved if taken in hand prompty.—Farmers' Bulletin 430.

GAMBLING IN MUSHROOMS.

Some more of our readers are tempted by certain claims of advertisers to try mushroom growing. It is well they should try, if they will not set their expectations too high. Of all garden crops or cellar crops or greenhouse crops I have ever tried, the mushroom is the most elusive. At times I got some. At times I got none where I planted the spawn, and some (usually scattering) where I did not plant them. If everything goes right, you may get mushrooms four weeks after planting the spawn. You are more likely to get none in less than three months, and most likely to get none at all.—T. Greiner in Farm and Fireside.

CULTIVATION OF POTATOES.

As soon as possible after the potatoes are planted the cultivator should be started. This implement has four shovels, each four or five inches wide and about fifteen inches long, two on each side of the row, and is drawn by two heavy horses. These shovels should run as close as possible to the planted tubers without disturbing them. The first cultivation adds to the depth of the dirt over the seed, and permits the use of a light smoothing harrow without disturbing the tubers. The cultivator also loosens the soil on each side of the row and better fits it for the potato roots which will soon invade it.

After this the potatoes should be harrowed once a week, if possible, first lengthwise of the rows and then across, until the vines are five to six inches high. This practice gets rid of the weeds so thoroughly that the use of the hand hoe in the row is rendered unnecessary. It destroys all the weeds in the hills and between the hills in the row.

After this the cultivator is used but is not run so deep as at the first cultivation. Frequent shallow cultivation keeps the surface of the soil loose, conserves the moisture, and gives a chance for the root system to spread.—Farmers Bulletin 386.

At a meeting of raisin growers at Reedley the million dollar corporation plan for handling raisins was favorably discussed.

MORSE'S Sweet Corn

OUR GOLDEN CREAM SWEET CORN is our sensational 1911 novelty. A yellow shoe-peg sweet corn of most delicious flavor. This will prove a most popular corn and we highly recommend it to our customers.

Our "1911 Garden Guide" is a splendidly illustrated catalogue of seeds, plants, bulbs and trees. It's free.

Questions and Answers

THE EDITOR AND STAFF

Questions to be answered in this department should be received at this office one week before reply is expected. Write plainly on one side of the paper and sign full name and address. Unsigned communications receive no attention.

Gophers.

Is there anything I can put around little trees to keep the gophers from barking them?—Subscriber, Anaheim.

The best thing to put around little trees to protect them from gophers is gopher traps. If trunks are protected the pests will still do injury to the roots, therefore complete eradication is the only safety. If the gopher trap is objectionable on account of time required, poisoning is the next best remedy.

Orange Vinegar.

How can I make orange cider, orange vinegar and orange wine?—Subscriber.

This question has been referred to several and has gone to Washington to the Bureau of Chemistry of the Department of Agriculture, and the most we have from them is, "We have no information on the subject." We will pass this on to our subscribers and will appreciate any information they can give us.

Duroc-Jerseys.

If the inquirer who recently asked for information regarding Duroc-Jerseys will write and give his address we can give information which may be of value to him.

Weevil in Beans.

Anent your reply to "Subscriber," about keeping weevils out of dried beans, I have an up-to-date neighbor who says carbon bisulphide will kill the weevil all right, but does not affect the unhatched eggs in the beans. He dips his beans in scalding water for a minute or two, then spreads out to dry and is never troubled with the pest. It is perhaps needless to add that the bean germ goes the road with the weevil germ and that beans thus treated should not be used for seed. —W. O. D., San Marcos.

Hardpan.

I am a beginner in the citrus fruit business. Am located in the foothill section of the San Jacinto mountains. Soil is decomposed granite so hard that I cannot turn with ordinary plow. We graded sufficient for 600 trees which were planted last season. I find in irrigating that the water does not reach down to the roots. In grading it is necessary to remove the surface on the higher parts and fill the lower. A few inches of the surface removed shows a stratum of soil composed of decomposed granite, very hard. On plowing with specially prepared points the ground can be broken into lumps which work into what feels like gravel as far down as the plow has entered, below that still the hard substance. How should this ground be fertilized and brought into best productive condition?—Subscriber, Hemet.

That our subscriber is correct in naming this soil decomposed granite, we question; the description is more that of a shale formation. In any case it is too complicated and difficult a proposition to prescribe for at this distance. Apparently it is a case of good, stiff hardpan, and whether its thickness, nature of subsoil and other conditions are such that it will pay to try to create a profitable orange property there can only be determined by careful examination. The use of a soil tester, or in its absence a good post hole auger, in various parts of the orchard would be the best way of securing information. If the surface is rich and underlying the hardpan is good subsoil, it is possible that blasting or work with a good subsoiler pulled by four or six mules might break it up and make of it a profitable orchard.

Tree Protectors.

How can I make at home tree protectors out of yucca palm?—J. H., Hinkley.

We question very much the ability of the inquirer to make home-made tree protectors from the yucca. We have seen the process of manufacture many times and it is indeed most simple but necessitates proper machinery and power. A large turning lathe with long knife shaves thin layers from the surface of the log, working in until the heart is reached. These long strips are then hung to dry and later cut up into small pieces for the tree protectors. We do not believe any hand contrivance could be made which would shave these strips off unless it cost too much to justify its use in so limited a way. The regular manufacturer advertising them in the Cultivator can doubtless supply them in large quantities very cheaply.

Plowing at Blossoming Time.

In your issue of the 16th you say don't plow deeply at blossoming time. Kindly tell me what is the best time to plow deeply and what is the right depth.—Subscriber, El Cajon.

The statement referred to was made in regard to citrus trees. It is generally considered that the shock to the citrus tree is sufficient to prevent setting of fruit, and we doubt not the same would be true with all deciduous trees. If the plowing can be done, say in February or early enough for recovery from the cutting of the roots, we do not believe there will be any perceptible injury. As to depth of plowing, that is a question of variety of trees and manner of handling in former years. We have seen orange orchards plowed eight and ten inches, sometimes even with subsoil plow, with generally beneficial results. We believe in deep plowing but it must be done with judgment, for if an orchard which has been given shallow culture for a period of years is plowed deeply on both the row sides, especially near blossoming time, the crop would probably be gone or reduced for that year. Again, time of plowing would depend somewhat upon the season, a warm spring causing early blossoming would call for early plowing.

Bees Dying.

I send bees for specimens. Others in hive seem to be killing them and throwing them out. These are smaller and black. The ground is covered with them. What is the cause and remedy?—Subscriber, Ceres.

Mr. C. H. Clayton of Los Angeles answers:

In absence of personal examination anything we may say is more or less of a guess. Our opinion is that it is nothing more nor less than an aggravated case of what is called "spring dwindling." The bees are dying of old age. The specimens sent were badly mashed in the mails and as far as we can see show no signs of disease, only abundant signs of old age. The colony probably went into winter quarters with scant stores and a very old queen, not being able to keep up to normal conditions have been dying

very rapidly and the living bees, as a sanitary measure are removing both the dead and dying.

If the queen is any good they will get over the trouble as soon as they can begin to gather nectar and pollen. It might be well, however, to take a comb of sealed brood about ready to hatch from another colony and give them, removing an empty comb and putting the sealed brood in the middle of the cluster. Follow this in a few days with another comb from some strong colony. This second comb should have larvae in all stages from fresh laid eggs to sealed brood. This will encourage the colony to get busy and if the queen is missing or old they will probably rear themselves a queen from the eggs you have given them. We see no occasion to destroy the old queen unless you have a laying queen to give them at once. The bees will attend to her case as soon as they find she is no longer doing her duty.

Hardpan for Olives.

Will you please tell a tenderfoot what kind of soil is best for olives. I have a piece of land that is a heavy brown clay loam with a few small spots of alkali. Some call those cement clay. They are grayish in color and I notice they do not absorb water. Would dynamite help any or would they run right together again as soon as irrigated? Those spots do not exceed two per cent of the land. Would you advise me to plant olives on this land or would those alkali spots be injurious to the trees. Would alfalfa grow on this land? It is all underlaid with hardpan 3 to 5 feet from the surface.—Subscriber, Lindsay.

We would prefer a lighter loam soil than that described for olives, and would prefer not to use land underlaid with hardpan. If we were to plant trees in this soil and the hardpan is underlaid with a loam, we would surely blast it for every tree, putting blasting powder well below the hardpan so as to lift and shatter it as much as possible. Of course, this is only generalization as knowledge of the hardpan, of the soil and the subsoil is necessary to an intelligent answer. There are some hardpans that roots will penetrate without necessity of blasting. As to whether the hardpan will run together and be equally as hard the next dry season depends upon its structure. The spots could best be handled by plowing under a heavy application of stable manure, and if black alkali, we would make application of gypsum.

Mr. Mills informs us that he has seen olives do exceptionally well on hardpan when blasting was done before planting.

Wire Worms.

A Dinuba subscriber sends very large specimen of wire worm, which was referred to Mr. E. O. Essig, of Santa Paula, and he writes:

"The worm from the Dinuba subscriber proves to be the larva or young of the elater beetle, which is commonly called snapping or click beetle. The adult form varies from three-quarters to one inch in length, and is very common. The young, known as wire-worms, feed upon the roots of all kinds of plants, including vines, weeds, grasses, vegetables, etc. If vegetation is allowed to grow in the vineyard during the winter months the beetles may be attracted in great numbers, so that during the summer months, the growing season of the vines, when the vineyard is clean cultivated, the wire-worms take to the roots of the vines, and may collect in great numbers. This has been found true in the vineyards near Hanford, where considerable damage has been done. But the fact that only a few worms were found near the roots of a great number of vines need not cause any alarm, since these larvae are common everywhere, and a few might be expected in hoeing twenty acres. In such a case no treatment is advisable. In fact, a satisfactory remedy is yet to be found for this pest. Carbon bisulfid may be used with some good effects, but is slow and expensive. Clean culture is perhaps the best method to employ. Keep the vineyard free from weeds throughout the year, and hoe or cultivate close to the vines."

Cannibal Chicks.

We have White Leghorn chicks two weeks old, some of which attack others in the pen and pick at them until killed.—Subscriber, Chico.

This is a hard trouble to overcome. It can be prevented by giving plenty of meat in the diet, but once the habit is formed the little fellows seem to prefer attacking their own kind, and it may be necessary to remove the most aggressive. With the next flock feed meat scraps or dried blood and in addition suspend a large head of lettuce or a small cabbage so that chicks have to jump and exercise to get it. Of course, the little ones which have been attacked should be removed at once.

Bats in the Belfry.

Those who are annoyed with bats in a belfry, or elsewhere, may secure relief by using a loose bunch of hemp or flax tow. If this is not available a piece of rope of fine fiber untwisted will answer. Pull it apart to make a thin netting and hang this over holes or in passways where the bats fly in and out. The hooked claws on their wings will catch in the tow and the more they struggle the worse they become entangled.—G. Cosner, Ontario.

O. I. C. Hogs.

What is the origin of Ohio Imported Chester hogs?—R. W. C., Los Angeles.

This strain of the Chester Whites was built up by Mr. L. B. Silver of Salem, Ohio, about 1865, and is simply the Chester Whites in the hands of an expert breeder who has properly selected his stock until a magnificent animal has been developed. The Chester White originated in Pennsylvania in 1820. After the Civil war these Pennsylvania hogs gained a wide reputation and Mr. Silver conceived the idea of bringing out the very best in the breed. They are classed amongst the largest swine known, ranging from five to six hundred pounds, but it is not uncommon to find them weighing a thousand pounds or more.

Chronic Indigestion.

A Jersey calf three weeks old was purchased in December and taken from the cow, and fed a mash of milk, bran, alfalfa meal and oil meal. After a week she refused this ration and was given rice water, milk and lime water and an occasional raw egg, with only temporary improvement. The alfalfa meal was dropped first, then the oil meal, and oat meal gruel was tried, but the bowels continued loose. So bran gruel was combined with it. Still her food passed undigested and now she refuses the bran. She has been allowed to run on green alfalfa and grass when the weather permitted, but she eats very little and the diarrhoea continues.—Subscriber, Anaheim.

Bran, oil meal and alfalfa meal are by-products, often containing refuse and damaged material which can be made soluble only by grinding, and doubtless one of the first ground foods given irritated the tender stomash of the young calf and resulted in chronic indigestion. Bran is poorly digested by young ruminants and cotton seed meal is poisonous to young

Available Nitrogen

is *the* thing in practical fertilizing.

Nitrate of Soda

is the cheapest and most available form of Nitrogen for all crops.

"The Cost of Available Nitrate," Sent Free

It is worth dollars to you. In this book Prof. Voorhees shows how the American farmer could have saved $17,000,000 on the cost of nitrogen in 1909. Address

calves. Cotton seed meal is now being freely mixed into the cheaper grades of linseed meal.

Feed the calf barley gruel, boiled milk and roasted oat meal or cracked oats. Physic with castor oil 3 or 4 ounces in boiled milk and follow with powdered cinnamon bark, powdered gentian and bismuth subnitrate equal parts, mixed and given in teaspoon doses three times daily.—F. G. M.

Fertilizers on Lemons.

When should lemon trees be fertilized, and how much should be applied? —Subscriber, Lemon Grove.

To answer this question would require a book. May we not ask our subscribers to be more explicit with questions. What is the age and condition of trees, nature of soil, is it exhausted by years of cropping, or is it virgin soil, is it a deep loam over gravel or a thin layer over hardpan, have you access to stable manure or must you buy commercial fertilizer? If we should prescribe for an old, exhausted orchard, it would not prove a satisfactory treatment for trees recently planted on virgin soil.

Our query department is growing beyond our capacity to care for properly. For it we are glad, for it is the aim of the Cultivator to be helpful, and we will do our best, but will our subscribers save us much time by a little extra care in stating their case?

Legal

Edw. L. Payne, attorney, 301-304 Douglas Building, Los Angeles, will answer legal queries in this department.

Immediate mail replies cannot be given except where fee to Mr. Payne is paid. When replies are wished in Cultivator address query to 115½ N. Broadway, Los Angeles.

Draining to Road Side.

A and B each own forty acre tracts on high side of county road. Wish to co-operate and lay tile through low land to county road ditch which has plenty of fall to carry the water along till it would seep away. C owns below road and has continuation of same slough but will not tile. Can C prevent A and B from draining onto county road? Can county prevent it? —Subscriber, Ventura.

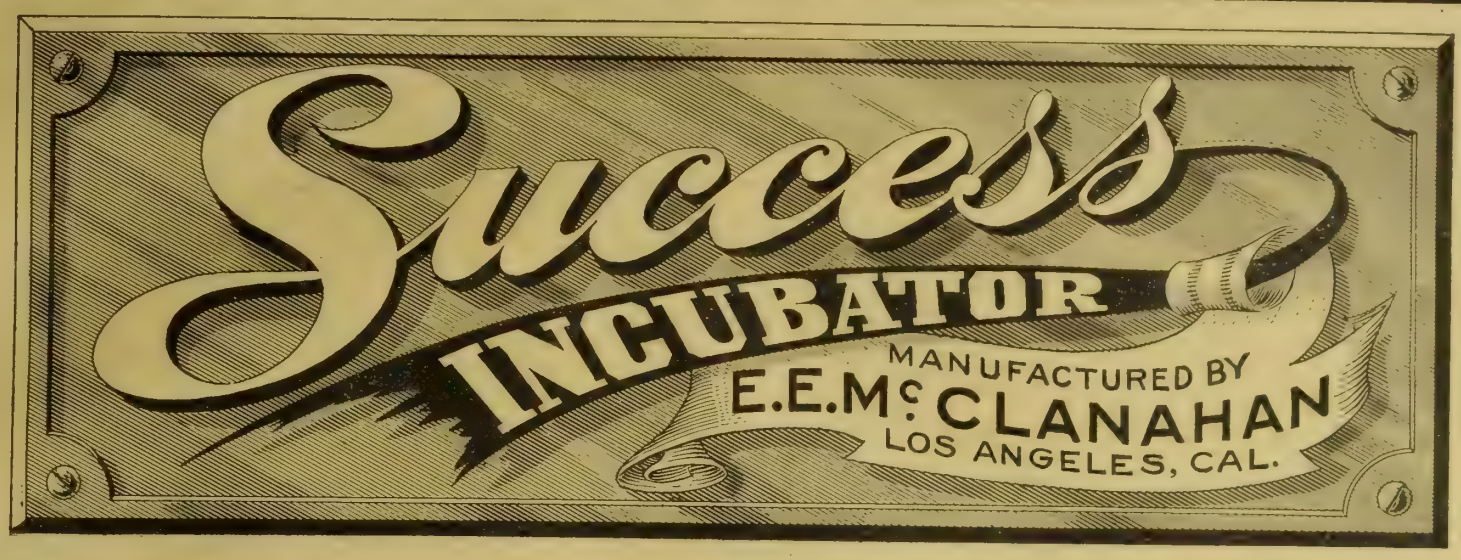
C can have no legal objection to the draining of A's and B's land onto county road, unless the drainage in some way injures him. The county can prevent such drainage if it is injurious to the county, otherwise not. —E. L. P.

Buried Horse.

A bought a piece of land from heirs of an estate. B an heir living on the property, is given notice that C has rented the place. B's horse dies and he buried it, leaving one foot exposed, 40 feet from house on D's land. Can B be compelled to move the horse? —Subscriber, Arroyo Grande.

B cannot be compelled to move the horse, but the owner of the land, or the one in possession under the lease, might recover damages for the nuisance.

Where the nuisance consists of something which can be done away with simply by ceasing to do that which is offensive, the courts will, in an action to abate the nuisance, enjoin it, but where, as in a case of this kind, to abate the nuisance would require the court to order the offending party to do something as distinguished from ceasing to do something, an injunction is almost never granted, and the only practicable remedy is for the party on whose land the nuisance is, to abate the nuisance himself and recover damages from the other party. In this instance, on account of the small consequence of the matter, it is probably better for the injured party to do the best he can without resort to the courts.—E. L. P.



Write me today. I want to send you my 48 page Free Catalogue telling all about Success Incubators and Brooders. Prices less by many dollars than others ask. Used by nearly all the large hatcheries in Southern California. A post card will do; just say you want a Success book.

Answers in this column by Dr. Fred G. Matthews, are without charge. For immediate mail answer remit $1.00. In writing questions give full symptoms or particulars of injury of animal.

Snake Bites.

We lose from one to three horses a year from the bites of the rattlesnake. We use the knife, ammonia and injections of permanganate of potash. Kindly instruct us as to the proper method of procedure and instruments, dosage and medicines to be kept on hand.—Subscriber, Plano.

The most important of all measures is to prevent if possible the absorption of the venom by applying a tourniquet, or a rubber band above the point of injury and then use the knife freely at the point the fang entered. If a tournaquet is not available, a strong strip of muslin twisted by the aid of a stick may be substituted. Encourage a free flow of blood from the wound by continual kneading, hand rubbing, etc. Abstraction of the venom is to be preferred to medicinal antidotes. After the blood has ceased to flow apply a strong solution of permanganate of potash on cotton pressed into the wound and bandage to hold in place. Ammonia is painful and less desirable as a local application. Hypodermic injections if not cautiously used, may prove as destructive as the bite.—F. G. M.

Cholera Serum.

I notice recent article on serum as a preventive of hog cholera. Where may this be had, how is it applied, how effective is it, may I keep it on hand and use in case cholera appears, or will it not keep?—Subscriber, Sheridan.

Hog cholera serum, prepared as recommended by the Bureau of Animal Industry, is known to retain its potency six months, and probably longer. Experiments have demonstrated that serum, to be of any value, must be made from the blood of swine. That from the blood of the horse or donkey is worthless. There is serum on the market said to be taken from the latter animals. Many of the state experiment stations, Iowa, Minnesota, Texas, etc., furnish serum to parties within their respective states, but I am not certain they send it to other states on any terms. The H. K. Mulford Company, Philadelphia, Pa., has placed the serum on the general market.

The serum should not be relied upon to cure hog cholera. It is used almost entirely as a protective agent. There is no question as to the efficiency of the serum when used for that purpose. The length of time injections of serum alone will protect hogs appears to be unsettled. Some say four weeks, others say four months. In order to prolong the period of protection, the vaccinated hogs are exposed to the disease by placing hogs sick with cholera among them, or blood containing living hog cholera germs is injected at the time of inoculation. This latter procedure is termed the "serum-simultaneous" method, and is not recommended for use except by specially trained veterinarians.

The dose for pigs weighing fifty pounds or less is 20 c. c., injected under the skin on the inner surface of the thigh. Larger doses are required for larger hogs.

In case the farmer decides to vaccinate his own hogs, it would be advisable not to purchase the serum till the disease appears in his neighborhood. But it would be well to have one or two graduated hypodermic syringes of 30 c. c. capacity on hand, and also have arrangements made in advance with those who are to prepare the serum, to supply it upon demand.

Since it is not advisable for persons other than trained veterinarians to use the disease-producing blood, and equally contrary to good advice to transport pigs sick with cholera to mingle with non-infected herds when vaccinated, as a means of prolonging the protection, and since it is known the protection from serum alone is only temporary, the proper course for the farmer to pursue would be to secure fresh serum when the disease threatens his herd, and hold it in readiness for use when the first pigs show symptoms of the disease.

The subscriber is advised to write the Department of Agriculture, Washington, D. C., for Farmer's Bulletin No. 379 on the subject of hog cholera. —F. G. M.

Lameness.

An old horse has become lame after working a single plow. The collar used was too large. The shoulder muscles are shrinking, and the chest muscles bag down some. Stiffness is noticeable after standing and when turning.—Subscriber, Hanford.

Examine the limb from the bottom of the foot up for complicating defects, such as sidebones, ringbone, splints, etc. A good liniment may be made of turpentine one part, ammonia one part, and sweet oil two parts. Shake and apply with brisk rubbing once or twice daily.—F. G. M.

Chewing the Bit.

How may I prevent a horse from chewing the bit?—Subscriber, La Mesa, Cal.

If by "chewing" the bit reference is made to the habit of champing while the bit is in the mouth, try changing for one less objectionable to the horse. Some horses take the bit between the first grinders. This may be remedied by cutting off the crown of the upper and lower teeth involved. Another disagreeable habit is tongue lolling. This is corrected by a bit constructed with an apron-like plate in the middle, which prevents the animal from getting the tongue above the bit.—F. G. M.

Correspondence Schools.

Can you tell me if horse training and breaking can be properly taught by mail, and could you recommend a trainer or school?—Subscriber, Norwalk, Los Angeles County.

I cannot recommend a correspondence course for horse training. Courage, skill and natural adaptability are prerequisites in the development of a successful horse trainer. I cannot understand how a correspondence school could give you much more information than could be acquired by reading books on the subject.—F. G. M.

Itch.

Some kind of itch has been spreading over the neck and sides of my mule. Other animals have not contracted the disease, though in constant contact with him during the past year. Round swellings a half inch in diameter form, break, and exude a yellow, watery matter, and the itching is intense. Otherwise the animal is in good health.—Subscriber, Jamacha, San Diego County.

Mix equal parts of boiled linseed oil and liquid sulphur, shake, and apply with rubbing. Repeat every third day. Give one tablesponful of Fowler's solution in the feed morning and evening.

Abscess.

A swelling under the throat of my cow breaks and runs at times. Before breaking it is as large as a man's fist, and very hard. It is just under the skin and appears not to involve the bone.—Subscriber, Winters.

When the abscess breaks press upon every part of the swelling to force out all the matter possible, then inject zinc chloride, ten per cent solution, into the tract with a syringe. Repeat the injections two or three times at intervals of fifteen minutes, endeavoring each time to force the liquid into all parts of the cavity. Wait five days, then begin injecting hydrogen peroxide once daily.—F. G. M.

ORANGE SAUCE.

Cream one tablespoonful of butter with one teaspoonful corn starch. Place in a double boiler and add the well beaten yolk of an egg, to which has been added two tablespoonfuls of powdered sugar and a cup of thin cream. Beat until light and cook over hot water until it begins to thicken, and then add the juice of an orange and serve at once.

Los Angeles, Cal.

"Let There be Light."

—PAT HENRY, before the battle of Bull Run.

We are not sure that our old friend Pat has been correctly quoted, neither do we know that he was anywhere near Bull Run during that memorial event, but we do know that every Rancher, Miner, Dairyman, Stableman and Teamster on the Pacific Coast should be in possession of at least one of our Vehicle Headlights, here illustrated.

There are times when a good, strong light is almost indispensable. It is needed around the barn, the thrasher, the harvester, on the gang-plow, on your wagon or buggy when driving over rough roads, the ranch, the mine or the dairy.

A Boesch Vehicle Headlight is worth a dozen ordinary hand lanterns. They are well made, strong and durable, each one is fitted with a highly polished silver plated parabolic reflector which concentrates the rays of light with remarkable brilliancy. The body is finished in a rich glossy black with polished brass trimmings, and for appearance it is first in order of handsome lamps. It embodies all our latest improvements, and for efficiency as a light producer it is without equal. This is the Headlight that caused the passing of the State Law prohibiting the hunting of wild ducks by artificial light. It is being used by nearly every Fire Department on the Coast and in many of the large Eastern cities.

Do not be led into buying a cheap, inferior lamp. It won't pay. This one is the result of forty-two years' experience in the business. It is home industry, and we guarantee satisfaction. It is made in 6, 8 and 12-inch sizes, measurements across the face.

We also manufacture many other styles of Headlights, Lamps, Lanterns, etc., too numerous to mention.

Write for Catalogue and full particulars of lamps or lanterns that you require.

BOESCH LAMP COMPANY

DWARF MILO MAIZE

A DRY LAND CROP

Where the rainfall is limited or water is expensive there is no more profitable forage and dry feed crop than **Milo Maize.** It belongs to the sorghum family of tropical Asia and Africa, where it is the principal grain grown.

We have secured a stock of a dwarf variety that has been thoroughly tested in Southern California and Arizona, yielding two and one half tons of grain per acre. It grows a stalk 4 to 5 feet high with large, compact, erect heads, and stock especially like the sweet flavor of the stalk.

Write for cultural directions and prices.

FREE TRIP TO SEE THIS HAY PRESS AT WORK

LOS ANGELES AND RETURN AT OUR EXPENSE

WE PAY YOU TO INSPECT THESE HAY PRESSES.

Instead of paying a salesman's fare to show you a small model of a hay press, we will pay your fare to Los Angeles and return, not exceeding $15.00, to examine our California Special New Century, full circle, all steel, self feed Hay Press and all others on sale there. It makes no difference which hay press you buy, we pay your railroad fare just the same.

When you see for yourself how this machine has been built expressly for heavy baling on the coast, how strong it is, how easy it is on horses, what smooth bales it turns out, you will understand why we make such an offer. It has 7-in step-over, pull power, high baling chamber, positive plunger rebound; it stands up to its work, no taking off of wheels. Has record of 39 tons per day. We will ship you one to try. If you don't want it we will pay freight both ways. Write now.

Anaheim, Cal.

Timely Ranch Suggestions

THE SUB-SOILER.

Address Before the Western South Dakota Dry Farming Association by Hon. Frank Gardner.

One lesson nature presents every year, and insists on its being learned, is that, since moisture is necessary for the growth of plants, it is possible for the farmer, by right cultural methods, to conserve a sufficient moisture supply for the ordinary summer crop, even without the summer shower. In many parts of the country the past season, like the two preceding years, there was a deficiency in rainfall, and many farmers placed the responsibility for poor crops upon providence, not noticing that the same providence dealt lavishly with the neighbor across the way.

The observing neighbor had learned years ago that a soil well filled with humus, plowed deep, thoroughly and continuously cultivated, would retain moisture through a long, dry season and produce a crop.

The Deep Seed Bed.

The proper preparation of the seed bed is the fundamental step in all successful farming. European farmers have recognized the important part it plays in the production of their lands, hence have become renowned for their excellent system and the consequent heavy yields. Some parts of America have adopted the European system of a more thorough preparation, but it has not become general in any section of this country.

The experimental stations of the several states, the federal department of agriculture, and the experience of the successful farmers of all countries, have established the fact that deeply-broken and well-pulverized seed beds give best results. The question might be raised as to what constitutes deep preparation. It can be briefly answered by saying that nothing less than eight inches could be called deep plowing, and the depths between this and 18 inches may be called real deep breaking. The depth to go in each instance can be governed only by circumstances and by the exercise of good judgment on the part of the farmer.

Deep Plowing.

In the past few years much has been said and written about the conservation of moisture, and all of our recognized authorities on this question agree that deep plowing is the first and most important thing to do. That is good as far as it goes, but we have a peculiar condition in all of the counties west of the river country. There are three factors that together bring about this peculiar condition referred to: First, the country is more or less rolling. Second, we have (generally speaking) a very hard clay subsoil, making it practically impossible for water to soak into it. Third, our rains come in heavy downpours. With these conditions, you can readily see that we do not get much, if any, benefit from the rains that fall from time to time, and these together have made this peculiar condition referred to—that is, a dry, hard blanket formation.

We can go out on the prairie in the spring and dig down from six to twelve inches from the surface, and we come in contact with this hard, dry soil that is from four to six feet in depth. And as long as this dry blanket formation is in evidence, we can not expect to be successful in the growing of crops, for the reason that we would have to depend entirely upon the summer showers, having no reserve moisture to draw from. It isn't the rains that come from above that insure our crops, but the moisture stored below that comes up by capillarity. There is no state in the United States that gets enough rain, at just the right time, to insure a good crop every year.

Sub-Soil Plow.

Real deep plowing will, in time, gather and hold enough moisture to soak through this dry blanket formation. But the sub-soil plow will bring about this result much sooner, for the reason that you can get down deep in that hard sub-soil, and by so doing make a reservoir for catching and storing the melting snows and heavy rains, instead of allowing them to run off the land into the ravines, into the creeks, into the Missouri river, and eventually into the Mississippi to assist in swelling the great floods that cause the loss of life and property.

A sub-soiler makes the sub-soil more pervious to water and plant roots. A sub-soiler is not intended to bring the sub-soil to the surface, in fact, I believe it would be a detriment rather than a benefit to the crop to do so, as sub-soil is usually devoid of humus.

It does, however, create a loose condition whereby water is rapidly absorbed, instead of running away on the surface and often washing the land and carrying fertility with it.

In nearly all of the West, the sub-soil must be loosened up to sufficient depth to admit of the percolation of all the water that falls.

Holding the Rainfall.

Whenever the farmer can go out on his plowed fields, regardless of how hard it is raining, and see any water escaping, his ground has not been plowed or sub-soiled deep enough. I know, by observation and actual experience, that a sub-soil opened up to a depth of 18 inches will absorb all of the moisture that comes in any of our downpours of rain.

The farmer that began sub-soiling a few years ago and has, by proper cultural methods, conserved as much of the moisture as possible, has succeeded in soaking up this dry blanket formation, made the connection between the moisture below and the moisture above, and made it possible for the water to rise by capillarity, and with a fine and well-firmed seed bed, raised good crops, producing as much as 21 bushels of good, marketable wheat to the acre. And by the use of the sub-soil plow, and practicing the up-to-date dry farming methods, the so-called semi-arid counties of the West will raise as good crops every year as are being raised in the more humid districts.

SQUIRREL ERADICATION.

We have a communication from Mr. Geo. DuQuitte of San Fernando in which he refers to a method of killing ground squirrels described once before in the Cultivator. However, his testimony as to its effectiveness induces us to publish as he sends it to us. Mr. DuQuitte says:

"Saturate a small cloth with gaso-

line or high grade distillate and insert well into the hole, then thoroughly tamp with dirt. This should be done in the middle of the day when the squirrels are sure to be in the holes. In a few days go over the ground in case any should be outside the holes and dig the others out."

THE INTERNATIONAL INSTITUTE OF AGRICULTURE.

The International Institute of Agriculture was established under the International Treaty of June 7th, 1905, which was ratified by forty governments. Seven other governments have since adhered to it.

It is a government institution in which each country is represented by delegates of its choice. The institute is composed of a general assembly and a permanent committee.

The institute, confining its operations within an international sphere, shall: Collect, study and publish, as promptly as possible, statistical, technical, or economic information concerning farming, both vegetable and animal products, the commerce in agricultural products, and the prices prevailing in the various markets; Communicate to parties interested, also as promptly as possible, all the information just referred to; Indicate the wages paid for farm work; Make known the new diseases of vegetables which may appear in any part of the world, showing the territories infected, the progress of the disease, and, if possible, the remedies which are effective in combating them; Study questions concerning agricultural cooperation, insurance, and credit in all their aspects; collect and publish information which might be useful in the various countries in the organization of works connected with agricultural co-operation, insurance, and credit; Submit to the approval of the governments, if there is occasion for it, measures for the protection of the common interests of farmers and for the improvement of their condition, after having utilized all the necessary sources of information, such as the wishes expressed by international or other agricultural congresses of sciences applied to agriculture, agricultural societies, academies, learned bodies, etc.

The institute publishes: a Monthly Bulletin of Agricultural Statistics; a Bulletin of Agricultural Intelligence and Diseases of Plants; a Monthly Bulletin of Economic and Social Intelligence.

David Lubin, formerly of this state, represents the United States in the institute. The work of the institute is not receiving as full support as it should on the part of this country. The three publications which have been distributed gratuitously will hereafter be charged for at the rate of 36 francs per annum.

THE RURAL TELEPHONE.

The day has passed when it was necessary to argue the value of the telephone in the farm home, and yet the matter is stated so convincingly in a paper recently read before a fruit growers' association in Georgia that it may be well to consider the points as brought out there. A subscriber sends the following synopsis of the paper:

"It is generally recognized that a nation's wealth comes from the productiveness of her fields. Any movement that tends to increase their fertility, or to improve conditions in the open country so as to turn the stream of population away from instead of into the cities and congested manufacturing centers, should receive constant encouragement.

"The one thing which has done most to hamper the South's development has been lack of transportation facilities. The one thing which will most easily, cheaply and effectually overcome this lack is a reliable method of quick communication. This is the part played by the telephone. And after the telephone come good roads and the rural mail carrier.

"Each one is an evidence of material prosperity—each one reduces the expenses of a farm, each one serves as a close link between the farmer and the outside world or the next-door neighbor. Only one, though, is on duty day and night, fair weather or foul, and instantly available. To receive the benefit of the good roads, you must hitch up a team; you must wait for the whistle of the rural free delivery man to get your paper or letters; but with the telephone in the house, a turn of the crank puts you in touch with points near or far.

"Probably the first and most direct appeal of the telephone is to the farmer's wife. She has less opportunities of getting away from home than other members of the family, she sees fewer new faces and receives fewer new ideas, so that anything which will serve to break the monotony of her life is welcomed as a Godsend. And the amount of visiting which can be done over a long rural line is truly surprising. All of the neighborhood news spreads along the wire even quicker than the 'grapevine telegraph' could tell it, and during bad weather or on cold winter nights, the 'voice in the box' is a great comfort.

"Besides its social side, though, another and even greater appeal the telephone makes is as an aid in emergencies. It is a watch dog that never sleeps, but that is always ready to summon assistance in any crisis. Two cases where a telephone saved a life have come to my attention within a week. One occurred at Eastman, Ga., where Mr. Bond had his left arm completely severed above the elbow in a gin. His wife immediately telephoned for a doctor eight miles away, who arrived twenty minutes later, soon enough to stop the hemorrhage and thus keep him from bleeding to death.

"The other case occurred at Hiram, Ga., where a little boy was bitten on the ankle by a rattlesnake. In less than two minutes a doctor seven and a half miles away had told the parents how to apply a bandage to stop the circulation, in twenty-five minutes the doctor himself was on the ground, and the boy's life was saved.

"In neither case would it have been possible to even notify the doctor in the total time it took the telephone to get him to the spot. Instances of this sort are not rare—they occur every day, and have gone a long way toward demonstrating the value of the telephone on the farm."

Among the factors which deserve credit for revolutionizing farm life, elevating the plane of farm living and bringing country and city into closer touch and harmony, none stands out more prominently than the rural telephone. Together with the rural free delivery, the interurban and the automobile it has made farm life not only more complete, but more profitable. In the grain belt the farm telephone has been accepted as one of the necessities of the home. The South seems to be behind the times in this respect, but the awakening cannot long be deferred. The telephone is not a plaything, it is not a luxury, it is one of the daily necessities of farm life. —Wisconsin Farmer.

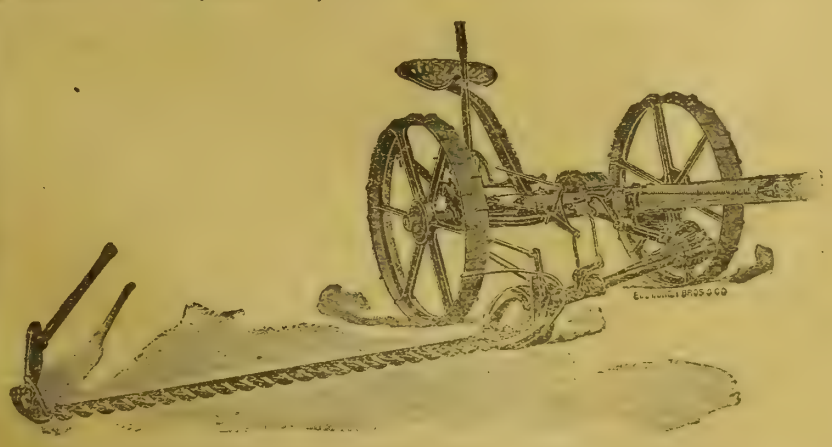
A FRICTION STORY

A small boy can slide faster down a smooth, greased board than he can down an ungreased board full of slivers.

MORAL: A mower which comes closest to eliminating friction will require the least power to operate.



THE NEW STANDARD MOWER

The Cutter Bar is curved when raised, so as to be mathematically straight, to form a frictionless channel for the knife, when lowered. This Bar is patented and can be used only on the New Standard Mower.

The entire weight of the Cutter Bar is transferred through the Suspension Spring to the main wheels. The bar is carried—overcoming the friction of a dragging bar which is pulled or pushed on the ground, besides adding to the grip of the drive wheel on the gear.

Steel Rollers surround the main shaft.

The New Standard Mower develops more cutting power from its special high speed gearing and the grip of the main wheels on the ground than is developed in any other mower—although less power is required to operate it on account of less friction.

A folder giving full detailed description of the New Standard Mower and our other Haying Tools will be mailed free on application.

Tillinghast, the Seedsman, Scranton, Pa.

Business

LARGE TRACT TO BE SUBDIVIDED.

A transaction involving 6000 acres belonging to the Crocker estate in Merced county was completed this week. The Co-operative Land and Trust Company of San Francisco has secured this tract and will begin the subdivision and colonization at once.

This deal marks a change in the policy of the Crocker estate, for heretofore no part of their great holdings has passed for sale into other hands. The Crocker estate of Merced county comprises about 37,000 acres, and includes some of the finest colonization land in the whole valley.

The greater part of the land involved lies about two miles north of Atwater. Three thousand acres will be placed on the market at once in five, ten and twenty-acre tracts.

The soil of the new tract is a very rich sandy loam similar to that throughout the Atwater district. It is especially adapted to the raising of alfalfa, peaches and grapes. This district is particularly famous for its sweet potatoes and the land is also adapted to the production of this profitable tuber.

The Co-operative Land and Trust Company is well known in Merced county, where they have colonized 9000 acres. The last colonization tract sold by them, which is known as "Merced Colony," adjoins the city of Merced.

IN SUNNY STANISLAUS.

One of the most important irrigation projects that has been opened in California for a long time is that of the Patterson Irrigated Farms, whereby 18,000 acres in Stanislaus county is now open to settlers, who will make a specialty of alfalfa, dairy products and deciduous fruits.

An absolutely modern system of irrigation has been established, including concrete lined ditches. One of the most wonderful electric pumping plants in existence is used for the elevation of the water from the San Joaquin River to the reservoirs supplying the land.

The property that will be served by this water supply is owned by the Patterson Farms Company. and Mr. L. G. Sinnard, the well-known land expert, formerly with the Southern Pacific Railroad, is general manager of the project. The Chas. F. O'Brien Company, of 112 West Sixth Street, are the Los Angeles sales managers and promise to prospective settlers a combination of perfect soil conditions and unlimited water now ready for delivery.

WAFFLES.

An Ohio man who is extremely fond of waffles is credited with the following statement:

"I have a regular formula for eating waffles," he said to a friend, "and I recommend it to everyone. You eat the first fourteen waffles without syrup, but with lots of butter. Then you put syrup on the next nine; and the last half dozen you eat just simply swimming in syrup. Eaten that way, waffles never hurt anybody."

Without endorsing his system, the following recipe for rice waffles will be found delicious for experimenting with: One and one-half cups cold boiled rice, one and one-half pints of flour, one cup thin sour cream, one tablespoonful sugar, one teaspoonful soda, a teaspoonful of salt, and three eggs. Beat eggs and sugar together and add to the rice and salt. Stir the soda into the cream and add to the first mixture, then stir in the flour. Beat to a batter thin enough to pour, and bake in hot, buttered waffle irons.

A SHORT CUT.

An easy and quick way to gather is on the machine. Loosen the tension of the machine slightly and stitch where the gathers are required. If the tension is loose the thread can be pulled easily and the gathers evenly arranged. This method is even better than that of using the gatherer.

General Household Notes

CALIFORNIA'S GOLDEN SPRING.

Wild pansies are here,
The beautiful things—
Pansies as golden
As new wedding rings.

Pale yellow cowslips,
And buttercups sway,
Poppies, our poppies,
Make all the land gay.

And we know it is spring
In this gold land of ours,
This radiant country
Of sunshine and flowers.
—Grace Hibbard in Sunset Magazine.

OUT OF THE FOG.

The skipper, who has been leaning back with his shoulders against the after bulkhead, bent forward and squared his arms on the table. "I've often enough called myself hard names for treatin' that boy as I did," he said. "But hard names don't split cut ropes, Mr. Burke."

I nodded. It was not my place to comment freely, for at that stage of my varied career I was filling the humble position of mate of the stout bark Arctic Hare. However, I had nothing to complain of. Captain Halyard treated me, unfortunately, as an equal—and where is the duke or king who can lay claim to more than that from a master mariner aboard his own ship?

"The boy was all for the sea, and wouldn't hear of any extra schoolin,' so I gave him a chance," continued the skipper. "He signed on with me for a voyage to Brazil and back as an ordinary seaman. He bunked and ate for'ard. That was his place. That's where I was when I first went to sea. He was in the mate's watch and I told the mate to see that he did his work.

"On Sundays I called him aft and let him read in here; but other days I treated him just like the other men —which was fair and square, but pretty undemonstrative. I thought it was all fine and noble of me, and used to brag about it to the mate. He wasn't enthusiastic, though. He said that nobody could consider his father as nothing but the skipper. I told him that was the right way of it, and that the lad would thank me for it some day, when sailing with a stranger.

"'On work days,' said I, 'I am the skipper. On Sundays I am his father. He understands that it's for his own good.'

"You see I was mighty sure of myself in those days!"

Here Captain Halyard paused, and stared vacantly at the gay cage of the skylight above him.

"Evidently something went wrong. How was that, sir?" I ventured.

"How was that " he exclaimed, sitting up, savagely. "Ah, if I could only forget how it was, Mr. Burke!"

His voice dwindled. He eyed me appealingly, and glanced away. "It was about his playing the accordion," he added.

I had nothing to say to that. I listened to the footsteps of the boatswain on the poop overhead. I could see that Halyard was anxious to tell me the story, and yet was ashamed of it. He fingered an almanac that lay before him, and fussed about it in a most exasperating manner.

"Well," he said, "to make it short, the boy had a weakness for playing the accordion. He played it well, too. He kept the fo'castle gay with his music.

"But it jarred on me, somehow or other; and one night I called him aft and told him to quit—told him that a boy who was content to pump tunes for a lot of common seamen would never get aft of the galley himself. He took the word quietly, standing here on this very strip of carpet, with his cap in his hand.

"If he'd argued, maybe it would have been better for both of us. About a week after that, late one night, I awoke and went on deck by way of the after companion, I heard the accordion playing very softly and cautiously. The man at the wheel had the tail of his eye on me.

"I went fo'ard, quiet as a thief in my canvas slippers. It was a fine night, with the moon clear and full and the trade blowing steady. The old girl was walking along as if a giant had her on a tow-line.

"Fo'ard of the men's deck-house I found Jack and the accordion. Both watches were squatting round. The lookout had his back to his business, and his eyes and ears on the player.

"I gave the boy a piece of what I thought was my mind. It was as nasty a tongue-lashing as you'd want to forget. At the end of it I told him I couldn't thrash him because he was a British seaman. Then I sent the men hopping and I went back to bed.

"Next Sunday Jack didn't come aft. Like a fool, I didn't send for him. So we made the round trip without another word between us. 'I'll fix him when we get ashore,' I used to say to myself.

"Well, Jack got paid off with the rest of the crew, and that's the last I have seen of him. I hear he is on the Banks, fishing with the Gloucester fleet now. About a year ago his mother received a letter from him, with a Boston postmark on the envelope."

Halyard stood up and pulled on his oilskins.

"That's the story, Mr. Burke," he said, quietly. "Please don't tell me what you think of it. I'm going on deck. You had better turn in."

Just then a seaman knocked on the door and opened it with a crack.

"T'ickenin' up, sir!" he said. "Bo'sun wants to know if he'll get out the foghorns."

"Yes," said the skipper. He pulled his sou'wester well down on his head, tied the strings under his chin, and followed the sailor. I hastened to my berth off the outer cabin, and, like the skipper, attired myself in rough weather clothes.

When I reached the high deck of the poop the fog lay over us and round us, cold and damp. One horn was being worked on the fo'castle-head and another on the poop. The noise was appalling.

"That's too much! Make it once in two minutes and alternately!" shouted the skipper to the boat swain.

"Aye, aye, sir," replied the boatswain, briskly.

Then, aside to me, "What do he mean by dat?" he asked.

"One at a time—turn and turn about," I whispered.

Halyard and I stood side by side, with our hands on the windward rail and the fog smoking round us. The old bark pitched to the gray valleys,

---The Largest, and Lowest-Priced Furniture House in Western America

Our immense store—150,000 square feet of floor space—and our immense reserve warehouse—the largest in the West—contain the largest stock of household and office furnishings carried in any establishment west of the Mississippi River. Furniture, pianos, carpets, Oriental and domestic rugs, wall papers, draperies, linens, mattresses, bedding, stoves, water heaters, table and kitchenware, etc. Largest assortments in all lines; lowest prices on all grades of goods; best terms for all classes of buyers.

We pack goods carefully and ship promptly to any point.
It will pay to buy of us if you live anywhere west of the Rocky mountains

and climbed again up the gray, unstable hills.

"No need of the lead to tell us we're in soundings," I remarked.

"We're on the Banks—just on the edge of them," replied the skipper.

"Queer we don't hear a horn or two in answer to the row we're making," I said, leaning over the iron rail of the poop and straining my eyes against the thickening fog.

"Hark!" said the skipper, with a hand on my shoulder. I turned an attentive ear to the wind.

"Don't you catch that?" he asked. His voice was low and eager.

I shook my head. I could hear nothing in the lull between the bellowing of our horns except the tumbling of the seas and the complaining passage of the ship.

"There!" Dead to windward!" exclaimed Halyard, after a minute's silence.

This time I caught something—hardly more than a suggestion of sound—like a faint strain of music. Then the horns gave tongue again, like a pack of unearthly hounds hunting in the fog.

When their clamor was done, the skipper glanced at me shyly.

"Wasn't it music?" he asked.

"I am not sure that I heard anything," I replied.

He had nothing to say to that.

Presently I heard the noise again, loud enough to be sure of it.

"It's an accordion," I said.

"See here, Mr. Burke," said Halyard, "what's a man about, playing an accordion off there in the fog? Is he just amusing himself? Or is it a signal? Or is he trying to keep up the hearts of himself and his dory mates?"

"The last two reasons seem likely enough, sir," I replied. "The playing sounds pretty weak, too.' '

"Take the port life-boat, Mr. Burke, and men from your own watch. We'll lay to."

I nodded and started down the ladder to the main deck.

The port life-boat was soon swung out and lowered. My four men of Harbor Grace pulled her up to windward with every ounce of muscle, from toes to shoulders, in the stroke. I glanced back. The bark loomed like a shadow in the fog.

The waves swelled above us with dizzy regularity. Now the rowers were under me, with their red, set faces turned upward. Now they were high above me, with all their weight on their feet. But they pulled as steady as clockwork, with Bill Duncan giving them the stroke.

Suddenly the accordion sounded again, close in front.

Bow-oar turned his head.

"Easy, all!" I cried.

A crest of gray sank under our cutwater, and there, in the valley, lay a dory. She was drifting sullenly before the wind. A figure crouched astern, steering with a fragment of board. A second figure sat forward, feebly closing and expanding a battered accordion.

The story was plain. The dory mates, fishing from a Banks' schooner, had been lost, probably for days, in the fog—a common enough accident there.

The dory wallowed to meet us. We drove along her gunwale, knocking the piece of deal from the steersman's hands. In less time than I'm taking to tell it we dragged the weak and bewildered voyagers into the boat, and pulled away from the dory. It was cleverly done, though I have to say it myself.

We pulled back to the ship with only two oars. The others of the crew held each a half-conscious fisherman, and forced brandy between his blue lips. We ran under the lee of the bark and tackled on, fore and aft, in short order. Then I gave the men the word, and they went up the "falls" like monkeys, and over the side. Anxious faces stared down at us under black sou-westers. I held the boat off with an oar. The rescued fishermen lay between the seats.

"Hoist away!" I shouted.

Up we went, clear of the bulwarks, and were swung in by eager hands. I jumped to the deck, and in so doing collided violently with the skipper. He shouldered me aside without a glance, and caught up the limp figure of the youth with the accordion.

"Jack!" he cried. "Jack, boy, it's your old daddy!"

We made way for him as he started aft with his burden. At the cabin door he turned. We could see that the lad's arm was round his neck.

"Mr. Burke, you see to his dory mate," he said. "It's food and blankets they want, poor lads!"

"Well," exclaimed the boatswain, as we rolled the other castaway in blankets, "if dat don't put the comether on de story books I has been readin', then ye may name me for a liar!"—Youth's Companion.

.. AN APRIL FOOLS' FROLIC.

Will you come for dance and play
On April first, the day,
At 8:30 by the clock.
Wear your most becoming frock.
We will not do things by rules,
We will all be April ——!

So the invitations ran, and the guests arrived at the house to find that the doorbell handle was tied tight; but the door opened mysteriously and a placard against the wall read, "This way to the dressing rooms." And when they went "this way," through the two doors at the end of the hall, they found themselves entering a dining room and a pantry and signs bearing the words, "April Fool," reminded them that they had not found the place where they could leave burdensome wraps.

But they succeeded after a little, and in the ladies' dressing room were funny surprises. The whisk broom holder held the buttonhook, pins were in the powder puff box, and the comb in the handkerchief box.

Signs on the doors, "Entrance" and "Exit," caused some fun, as the "Exit" proved to be a creepy sort of back stairway where the ever-present "April Fool" maxim greeted the confused guest at the bottom.

The guests were told to go out into the kitchen to make fudge. There were many glances at pretty silk waists by dainty maidens, but in the kitchen under the chocolate cakes, the butter pot and sugar bowl, little cards saying "April Fool" caused a gay fluttering of skirts as a bright waltz from the deserted parlor led them back to its kindly four walls again.

Favors of cornucopias, presumably holding candy, were distributed when the dancing reached its height, but they were found to be weighted with a few shot, while an artificial flower was the only other inclosure. These were in twos, one pink rose in a lady's cornucopia, one in a man's; two bunches of daisies, two of red roses and so on, while little verses gave the instruction:

Seek your partners by this posy—
May your luck be fair and rosy,
May you play the game of hearts,
Playing each the others' parts.

Little tables were provided and tally

cards given, all made ready for a game of cards, when lo! the tally cards being turned over, told a different story.

An April Fools party can have ever so many variations. Try it and see how willing everybody will be to play the fool for once, so long as it is only an April Fool.

RAISIN BREAD.

In view of the coming raisin day the Fresno Republican waxes eloquent over raisin bread as follows:

There are two sorts of people in the world. One sort eats rice and fish. The other sort eats bread and beef. And, so far, with the single exception of the Japanese, the rice and fish nations have been compelled to yield precedence to the bread and beef ones.

So bread is the staff of life, and at least half of the fount of courage. From bread comes the world's brain and brawn; the wheat farmer is the pioneer of the world's civilization; the wheat market is the barometer of the world's trade. North, South, East and West of the wheat line dwell strange races of dark men, with strange customs, costumes and religions. Within the wheat line dwells our sort of civilization. And, looking back in time instead of out in space, we find that the democracy of modern life dates from the time when wheat bread became the common diet of the common people.

So bread makes a race, a civilization, an era, and an industrial system.

Now comes the new era, when bread is to be not merely the staff, but the crown of life—the era of raisin bread. No longer a mere staple—the prose of dietetics and commerce—bread takes on with its raisins the romance and poetry of the vine. It becomes bread, meat and dessert; staple, substantial and luxury; grain and fruit are sweet. Bread-fed armies have conquered for European civilization all that has been conquered. On "molita cibaria," Caesar's armies unified the world. The outside civilization has broken the ancient ramparts on only one corner—the Turkish intrusion. And Turkish soldiers are fed on raisins! So, adding raisins to bread, we add to the ration that conquered all worlds except one, the ration which conquered that one.

Forgotten the fish-rice age; ignored the fish-rice nations! Proudly remembered the era and the world of bread! But welcome, thrice welcome, the new age and the new peoples and the higher civilization, founded on raisin bread!

THE HOME BEAUTIFUL.

There are so many little things we can do that cost little both in time and in money, yet count so much in the making of the home beautiful. For instance, take papa's old pants; how many of you stop to think out the possibilities of using them in the home? And yet they can be used in more attractive little ways, when off papa, than you would ever dream was possible!

I have one bright little friend who has utilized them in such a pretty, sweet way, by making hanging jardinieres. This she does by tying the bottom of each leg with bows of ribbon, filling the whole with sand, then planting ferns at the top and hanging them up by the suspenders.

This is a particularly pretty decoration for a bay window, especially if papa is a stout man, for then, of course, the contour of both the pants and the window coincide, which is always a good point in interior decoration, as all lines should be harmonious.

Another pretty idea is to use them as parlor portiers. This can be done with very little work and small expense, by tacking the waistband to the upper frame of the door, and drawing a leg back to each side of the door frame and fastening it there with a cord or bright ribbon. You have no idea, girls, what a sweet effect this gives, and it is absolutely good taste for any room or hall.

If they are so worn as to be fringed at the bottom, so much the better, as fringed portieres are oftentimes handsomer than when only hemmed. Red flannel underpants are especially pretty and cheerful used in this way during the winter, while all weights and colors look well at the windows during the entire year, if draped over lace curtains.

Of course a great deal depends on the size and shape of your papa. If he be tall and slender one of his legs will make a long pincushion, such as are so much in vogue now for dressing table use. This can readily be done by cutting the pants leg the desired length, stuffing with sawdust, and sewing securely at both ends. When covered with a dainty bit of lace this makes the prettiest cushion imaginable.—Helen S. Woodruff in Harper's Weekly.

OSTRICH PLUMES FOR DRESSY HATS.

For dress hats, ostrich is used more than any other feather trimming, in all sizes, from tips, which are used in full clusters, to long Amazon plumes and bands, either plain or willowed, almost a yard and a half long, and tall willowed "Grenadier" pompons. The new item in ostrich, and which has been used to a limited extent this winter, is the "Defrise" plume, which looks like a drooping French curled plume which has had every vestige of curl taken out by dampness. The new shadings and color combinations are in soft tones, and are both novel and handsome, and which tend to bring ostrich more into favor than if only plain colors or black were shown.—The Millinery Trade Review.

SURE ENOUGH, WHICH?

Little four-year-old Robert, like many other boys of his age, liked to ask questions. So when the first downy chicks came in the spring and his mother saw him studying them most intently, she knew something was coming. And it did, for presently he turned to his mother and asked, "Mamma, are chickens' legs hind legs or front legs?"—Woman's Home Companion.

Indispensable in Emergencies

THE sickness of a valuable animal on the farm demands prompt remedies.

It's a case for the veterinary—a case where minutes count. That's where the Bell Service shows its value to the farmer.

By means of the telephone the veterinary is reached, and he at once tells the farmer what to do until he arrives.

No far-sighted farmer gets along without the protection of the Bell Service.

He can never tell when it is going to save him from serious loss. Besides, he has daily proof of its usefulness.

Consult our local manager for rates.

Hay.

Scott, Magner and Miller say:

Arrivals of hay for the past week have amounted to 2,825 tons, a slight increase over those of last week, which were 2,424 tons. Receipts moved off fairly well, although there has been no advance in prices of any description of hay in this city or Oakland. People seem to be unwilling to pay more for hay than they have been paying, and buy from hand to mouth, which does not make a demand sufficient, with the receipts as heavy as they are, to cause any advance in prices.

Considerable hay has changed hands in the country of late at prices in excess of this market.

There has been somewhat of demand in the country for hay, but prices obtained when freight rates are added are on a par with the prices prevailing in San Francisco.

Export demand has taken on a very quiet appearance since the government took delivery of their final shipment on the steamship Mongolia last week, and there is nothing of interest in this line.

Alfalfa and straw remain unchanged.

We quote the wholesale prices in round lots on today's market, as follows:

Fancy wheat	13.00@13.50
No. 1 wheat or wh and oat	10.00@11.00
No. 2 wheat or wh and oat	9.00@10.00
Choice tame oat	10.00@11.00
Other tame oat	7.50@9.50
Wild oat	7.00@9.00
Stock hay	5.00@6.50
Alfalfa, ton	9.00@10.50
Straw	40@50

Grain.

Shorts	25.00@26.00

Citrus Fruit Market

LOS ANGELES, March 29, 1911.

A little carelessness in the matter of picking and packing immediately after the storms is resulting in heavy losses from decay. It is possible the picking was begun too soon after the rain and was somewhat soft. In any case very heavy decay, sometimes to the extent of 30 per cent, has resulted in bad conditions. The variation is, however, great, a little fruit going forward without any decay, but the greater part of it showing 10 to 12 per cent. This condition has, of course, depressed the market, though strictly sound fruit of first grade will yet demand $2.50 on nearly all markets.

Lemons are still stronger than last week, and every offering is promptly cleaned up at top of the market. It is probable this condition will be maintained until the warm weather gives a still bigger boost to the prices.

Shipments.

Shipments of oranges to date since November 1, 1910, 16,845 cars; lemons, 1,979; total, 18,824. To same date last season: Oranges, 10,835; lemons, 1,652; total, 12,487.

LOS ANGELES, Friday, March 24.—Six cars oranges sold here today.

Coulson's

MADE IN PETALUMA

Special chick food

If nature hatches the egg, you should save the chick. And you can do it with Coulson's Special Chick Food—the greatest life-saver known in the chicken industry.

This food is the result of years of study to get just the right ingredients in a proper mixture to save the largest possible number out of every 100 chicks.

Coulson's Special Chick Food is an investment, not an expense. It pays big dividends by starting chicks on the road to profit for you. Costs about one cent a chick for four weeks' feeding.

Coulson's Growing Chick Food must be used after the first six weeks, to keep up the steady growth of the chicks up to three months, at which time they are old enough to use Coulson's Egg Food—the standard feed for laying hens.

At your dealer's or from us. Write for the interesting book, "Poultry Feeding for Profit." It's free.

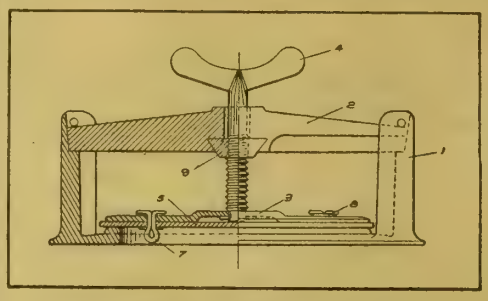
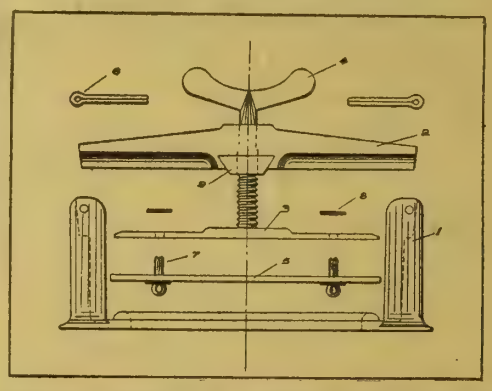
POMONA CIRCULAR VALVE





THE main object of the Pomona Valve is to construct a very cheap and simple valve, and one that requires no special tools or wrenches or experience to operate.

The Pomona Valve is constructed with non-corrosive parts, thus insuring a workable valve regardless of infrequent use. All fastening held in place by cotter pins, thereby making a very cheaply constructed valve and yet a very substantial one.
